

CSE4203: Computer Graphics  
Chapter – 8 (part - B)  
**Graphics Pipeline**

# Outline

- Bresenham's Circle Drawing Algorithm

## Assumptions

Given,  
Radius  $R$

circumference

We have to develop an algorithm that generates this circumference

## Assumptions

The first pixel of the circumference is plotted on  $(0, R)$

Given,  
Radius  $R$

## Observation

The first pixel of the circumference is plotted on  $(0, R)$   
Then the plotting of next pixels starts clock-wise....

That means the plotting starts from  $(0,R)$  and moving into the 2<sup>nd</sup> Octant

## Observation

while moving through the 2<sup>nd</sup> octant, the X value is increasing and Y value is decreasing

## Observation

## Observation

## Observation

## Observation

So, if we can obtain  $(X, Y)$  in 2<sup>nd</sup> octant, we can calculate the points-

- 7<sup>th</sup> Octant :  $(X, -Y)$
- 6<sup>th</sup> Octant :  $(-X, -Y)$
- 3<sup>rd</sup> Octant :  $(-X, Y)$

So, if we can obtain  $(X, Y)$  in 2<sup>nd</sup> octant, we can simply swap  $X$  and  $Y$  to get the points-

- 1<sup>st</sup> Octant :  $(Y, X)$
- 8<sup>th</sup> Octant :  $(Y, -X)$
- 5<sup>th</sup> Octant :  $(-Y, -X)$
- 4<sup>th</sup> Octant :  $(-Y, X)$

## Drawing in all the octants

So, if we can obtain  $(X,Y)$  in 2<sup>nd</sup> octant, we can calculate the points in other 7 octants

So, our target is to get the pixels of only 2<sup>nd</sup> octant of the circumference

## Bresenham's Circle Drawing Algorithm: How it works

## Bresenham's Circle Drawing Algorithm: How it works

Next pixel is chosen  
(from E or SE) to build  
the line successively

## Bresenham's Circle Drawing Algorithm: How it works

Next pixel is chosen  
(from E or SE) to build  
the line successively

## Bresenham's Circle Drawing Algorithm: How it works

Next pixel is chosen  
(from E or SE) to build  
the line successively

## Bresenham's Circle Drawing Algorithm: How it works

Next pixel is chosen  
(from E or SE) to build  
the line successively

## Bresenham's Circle Drawing Algorithm: How it works

Next pixel is chosen  
(from E or SE) to build  
the line successively

## Bresenham's Circle Drawing Algorithm: How it works

Next pixel is chosen  
(from E or SE) to build  
the line successively

## Bresenham's Circle Drawing Algorithm: How it works

As we know that,  
In 2<sup>nd</sup> Octant :  $X < Y$   
In 1<sup>st</sup> Octant :  $X > Y$

**We will stop when  $X > Y$ ,  
that means when 2<sup>nd</sup> octant  
is completed**

## Equation of Circle and its function representation

$$x^2 + y^2 = R^2$$

$$F(x, y) = x^2 + y^2 - R^2 = 0$$

## Equation of Circle and its function representation

$$F(x, y) = x^2 + y^2 - R^2$$

If  $F(X, Y) = 0$ , the point  $(X, Y)$  on the circle

If  $F(X, Y) > 0$ , the point  $(X, Y)$  is outside the circle

If  $F(X, Y) < 0$ , the point  $(X, Y)$  is inside the circle

## Selecting E or SE

## Selecting E or SE

Selecting E or SE depends  
on closeness to the  
circumference.

If E is closer to  
circumference,  
then E is selected

If SE is closer,  
then SE is selected

## Selecting E or SE using Mid Point Criteria

If midpoint M is outside the circle, SE is closer to the circumference,  
So, **SE** is selected

If midpoint M is inside the circle, E is closer to the circumference,  
So, **E** is selected

## Selecting E or SE using Mid Point Criteria

We know,  $F(x, y) = x^2 + y^2 - R^2$

Lets put the mid point **M**'s coordinate in function  $F(X, Y)$

$$F(M) = F(X_P + 1, Y_P - 0.5) = (X_P + 1)^2 + (Y_P - 0.5)^2 - R^2$$

Lets store **F(M)** in a variable **d**

So, **d = F(M)**

**d** is called 'decision variable'

## Selecting E or SE using Mid Point Criteria

If  $d \geq 0$ , then midpoint M is outside the circle, SE is closer to the circumference,  
So, **SE** is selected

If  $d < 0$ , then midpoint M is inside the circle, E is closer to the circumference,  
So, **E** is selected

## Bresenham's Mid Point Criteria : Successive Updating (for selecting E)

$$\begin{aligned}d_1 &= F(M_1) \\&= F(X_P+1, Y_P-0.5) \\&= (X_P+1)^2 + (Y_P-0.5)^2 - R^2\end{aligned}$$

## Bresenham's Mid Point Criteria : Successive Updating (for selecting E)

$$\begin{aligned}d_1 &= F(M_1) \\&= F(X_P+1, Y_P-0.5) \\&= (X_P+1)^2 + (Y_P-0.5)^2 - R^2\end{aligned}$$

If  $d_1 < 0$ ,  $E(X_P+1, Y_P)$

## Bresenham's Mid Point Criteria : Successive Updating (for selecting E)

$$\begin{aligned} d_1 &= F(M_1) \\ &= F(X_P+1, Y_P-0.5) \\ &= (X_P+1)^2 + (Y_P-0.5)^2 - R^2 \end{aligned}$$

If  $d_1 < 0$ ,  $E(X_P=X_P+1, Y_P)$

$$\begin{aligned} d_2 &= F(M_2) \\ &= F(X_P+2, Y_P-0.5) \\ &= (X_P+2)^2 + (Y_P-0.5)^2 - R^2 \\ &= X_P^2 + 4X_P + 4 + (Y_P-0.5)^2 - R^2 \\ &= X_P^2 + 2X_P + 1 + (Y_P-0.5)^2 - R^2 + 2X_P + 3 \\ &= d_1 + (2X_P + 3) \end{aligned}$$

## Bresenham's Mid Point Criteria : Successive Updating (for selecting E)

$$\begin{aligned} d_1 &= F(M_1) \\ &= F(X_P+1, Y_P-0.5) \\ &= (X_P+1)^2 + (Y_P-0.5)^2 - R^2 \end{aligned}$$

If  $d_1 < 0$ ,  $E(X_P=X_P+1, Y_P)$

$$\begin{aligned} d_2 &= F(M_2) \\ &= F(X_P+2, Y_P-0.5) \\ &= (X_P+2)^2 + (Y_P-0.5)^2 - R^2 \\ &= X_P^2 + 4X_P + 4 + (Y_P-0.5)^2 - R^2 \\ &= X_P^2 + 2X_P + 1 + (Y_P-0.5)^2 - R^2 + 2X_P + 3 \\ &= d_1 + (2X_P + 3) \end{aligned}$$

Every iteration after **selecting E**, we can successively update our decision variable with-

$$\mathbf{d_{NEW} = d_{OLD} + (2X_P + 3)}$$

## Bresenham's Mid Point Criteria : Successive Updating (for selecting SE)

$$\begin{aligned}d_1 &= F(M_1) \\&= F(X_P+1, Y_P-0.5) \\&= (X_P+1)^2 + (Y_P-0.5)^2 - R^2\end{aligned}$$

## Bresenham's Mid Point Criteria : Successive Updating (for selecting SE)

$$\begin{aligned}d_1 &= F(M_1) \\&= F(X_P+1, Y_P-0.5) \\&= (X_P+1)^2 + (Y_P-0.5)^2 - R^2\end{aligned}$$

If  $d_1 \geq 0$ , SE( $X_P=X_P+1, Y_P-1$ )

## Bresenham's Mid Point Criteria : Successive Updating (for selecting SE)

$$\begin{aligned}d_1 &= F(M_1) \\&= F(X_P+1, Y_P-0.5) \\&= (X_P+1)^2 + (Y_P-0.5)^2 - R^2\end{aligned}$$

If  $d_1 \geq 0$ , SE( $X_P = X_P+1, Y_P-1$ )

$$d_2 = F(M_2)$$

.... DIY....

$$= d_1 + (2X_P - 2Y_P + 5)$$

Every iteration after **selecting NE**, we can successively update our decision variable with-

$$d_{\text{NEW}} = d_{\text{OLD}} + (2X_P - 2Y_P + 5)$$

## Bresenham's Mid Point Criteria : Successive Updating (summary)

If  $d < 0$ , then midpoint  $M$  is inside the circle,  $E$  is closer to the circumference,  
So,  **$E$  is selected** and do-  
 $d = d + \Delta E$   
Where,  $\Delta E = 2X_P + 3$

If  $d \geq 0$ , then midpoint  $M$  is outside the circle,  $SE$  is closer to the circumference,  
So,  **$SE$  is selected** and do-  
 $d = d + \Delta SE$   
Where,  $\Delta SE = 2X_P - 2Y_P + 5$

## Initialization

$$\begin{aligned}d_{\text{INIT}} &= F(M_1) \\&= F(1, R-0.5) \\&= (1)^2 + (R-0.5)^2 - R^2 \\&= 1 + R^2 - R + 0.25 - R^2 \\&= 1.25 - R\end{aligned}$$

## Initialization

$$\begin{aligned}d_{\text{INIT}} &= F(M_1) \\&= F(1, R-0.5) \\&= (1)^2 + (R-0.5)^2 - R^2 \\&= 1 + R^2 - R + 0.25 - R^2 \\&= \mathbf{1.25 - R} \\&\approx \mathbf{1 - R}\end{aligned}$$

## Initialization

$$R = 2$$

$$d = 1.25 - R = -0.75$$

$$R = 2$$

$$d = 1 - R = -1$$

**So, finally.....**

$$\mathbf{d}_{\text{INIT}} = \mathbf{1} - \mathbf{R}$$

If  $\mathbf{d} < \mathbf{o}$ , then  $\mathbf{E}$  is selected,  $\mathbf{d} = \mathbf{d} + \Delta\mathbf{E}$

If  $\mathbf{d} \geq \mathbf{o}$ , then  $\mathbf{SE}$  is selected,  $\mathbf{d} = \mathbf{d} + \Delta\mathbf{SE}$

Where,

$$\Delta\mathbf{E} = 2\mathbf{X}_p + 3$$

$$\Delta\mathbf{SE} = 2\mathbf{X}_p - 2\mathbf{Y}_p + 5$$

```
void MidpointCircle(int radius)
{
    int x = 0;
    int y = radius ;
    int d = 1 - radius ;
    CirclePoints(x, y);
    while (y > x)
    {
        if (d < 0) /* Select E */
            d = d + 2 * x + 3;
        else
        {
            /* Select SE */
            d = d + 2 * (x - y) + 5;
            y = y - 1;
        }
        x = x + 1;
        CirclePoints(x, y);
    }
}
```

```
void MidpointCircle(int radius)
{
    int x = 0;
    int y = radius ;
    int d = 1 - radius ;
    CirclePoints(x, y);
    while (y > x)
    {
        if (d < 0) /* Select E */
            d = d + 2 * x + 3;
        else
        {
            /* Select SE */
            d = d + 2 * (x - y) + 5;
            y = y - 1;
        }
        x = x + 1;
        CirclePoints(x, y);
    }
}
```

```
CirclePoints (x,y)
    Plotpoint(x,y) ;
    Plotpoint (x,-y);
    Plotpoint(-x,y) ;
    Plotpoint(-x, -y);
    Plotpoint(y,x) ;
    Plotpoint(y, -x);
    Plotpoint(-y, x);
    Plotpoint( -y, -x);
end
```

**Given:**

Radius ,  $R = 10$

## Example

### Given:

Radius,  $R = 10$

$(x, y) = (0, 10)$

$h = 1 \quad -R = -9$

## Example

### Given:

Radius ,  $R = 10$

$(x,y) = (0,10)$

$h = 1 - R = -9$

K	1						
2x	0						
2y	20						
h							
(x,y)							

## Example

### Given:

Radius ,  $R = 10$

$(x,y) = (0,10)$

$h = 1 - R = -9$

K	1						
2x	0						
2y	20						
h							
(x,y)	E(1,10)						

$h \leq 0, E$

## Example

### Given:

Radius ,  $R = 10$

$(x,y)=(0,10)$

$h = 1 - R = -9$

$h = h + \Delta E = h + 2x + 3$

$= -9 + 0 + 3$

$= -6$

K	1						
2x	0						
2y	20						
h	-6						
(x,y)	E(1,10)						

## Example

### Given:

Radius ,  $R = 10$

$(x,y) = (0,10)$

$h = 1 - R = -9$

K	1	2					
2x	0	2					
2y	20	20					
h	-6						
(x,y)	E(1,10)						

## Example

### Given:

Radius ,  $R = 10$

$(x,y)=(0,10)$

$h = 1 - R = -9$

K	1	2					
2x	0	2					
2y	20	20					
h	↘ -6						
(x,y)	E(1,10)	E(2,10)					

$h \leq 0, E$

## Example

### Given:

Radius ,  $R = 10$

$(x,y)=(0,10)$

$h = 1 - R = -9$

$h = h + \Delta E = h + 2x + 3$

$= -6 + 2 + 3$

$= -1$

K	1	2					
2x	0	2					
2y	20	20					
h	-6	-1					
(x,y)	E(1,10)	E(2,10)					

## Example

### Given:

Radius ,  $R = 10$

$(x,y)=(0,10)$

$h = 1 - R = -9$

K	1	2	3				
2x	0	2	4				
2y	20	20	20				
h	-6	-1					
(x,y)	E(1,10)	E(2,10)					

## Example

### Given:

Radius,  $R = 10$

$(x,y) = (0,10)$

$h = 1 - R = -9$

K	1	2	3				
2x	0	2	4				
2y	20	20	20				
h	-6	↙ -1					
(x,y)	E(1,10)	E(2,10)	E(3,10)				

$h \leq 0, E$

## Example

### Given:

Radius ,  $R = 10$

$(x,y)=(0,10)$

$h = 1 - R = -9$

$h = h + \Delta E = h + 2x + 3$

$= -1 + 4 + 3$

$= 6$

K	1	2	3				
2x	0	2	4				
2y	20	20	20				
h	-6	-1	6				
(x,y)	E(1,10)	E(2,10)	E(3,10)				

## Example

### Given:

Radius ,  $R = 10$

$(x,y) = (0,10)$

$h = 1 - R = -9$

K	1	2	3	4			
2x	0	2	4	6			
2y	20	20	20	20			
h	-6	-1	↓ 6				
(x,y)	E(1,10)	E(2,10)	E(3,10)	S(4,9)			

$h > 0, SE$

## Example

### Given:

Radius ,  $R = 10$

$(x,y)=(0,10)$

$h = 1 - R = -9$

$$\begin{aligned} h &= h + \Delta SE = h + 2x - 2y + 5 \\ &= 6 + 6 - 20 + 5 \\ &= -3 \end{aligned}$$

K	1	2	3	4			
2x	0	2	4	6			
2y	20	20	20	20			
h	-6	-1	6	-3			
(x,y)	E(1,10)	E(2,10)	E(3,10)	S(4,9)			

## Example

### Given:

Radius ,  $R = 10$

$(x,y)=(0,10)$

$h = 1 - R = -9$

K	1	2	3	4	5	6	7
2x	0	2	4	6	8	10	12
2y	20	20	20	20	18	18	16
h	-6	-1	6	-3	8	5	6
(x,y)	E(1,10)	E(2,10)	E(3,10)	S(4,9)	E(5,9)	S(6,8)	S(7,7)

## Example

### Given:

Radius ,  $R = 10$

$(x,y)=(0,10)$

$h = 1 - R = -9$

Untilly  $y > x$

K	1	2	3	4	5	6	7
2x	0	2	4	6	8	10	12
2y	20	20	20	20	18	18	16
h	-6	-1	6	-3	8	5	6
(x,y)	E(1,10)	E(2,10)	E(3,10)	S(4,9)	E(5,9)	S(6,8)	S(7,7)

# Practice Problem

- Perform the midpoint algorithm to draw a circle's portion at 7<sup>th</sup> octant which has center at (2,-3) and a radius of 7 pixels. Show each iterations and plot the points.
