

Suppose ID 140204104 is uploading his report and Proteus project files for Experiment 07. Experiment 07 has two questions.

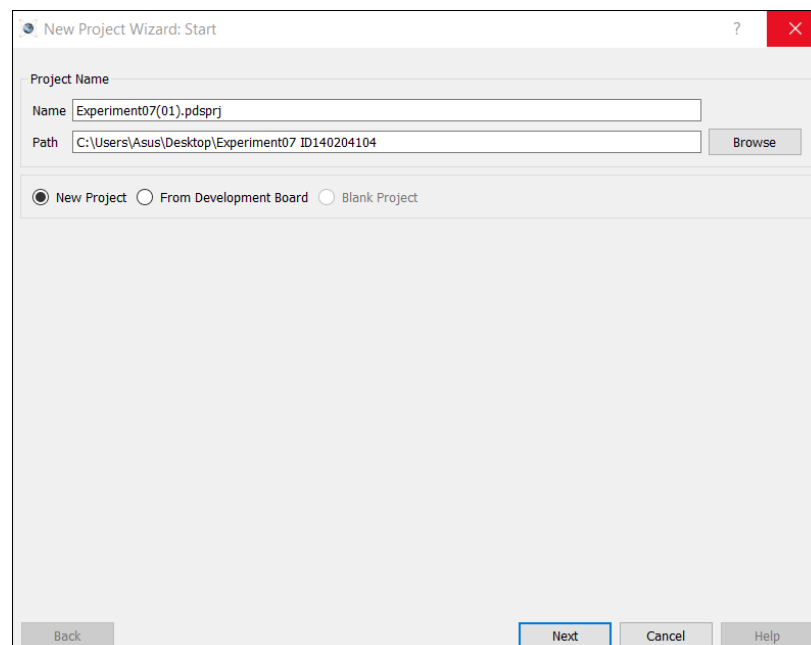

- i. First he would open a folder and name it as **Experiment07 ID140204104** . So, create a folder and name it as **Experiment[ExperimentNo][space]ID[YourStudentID]**.

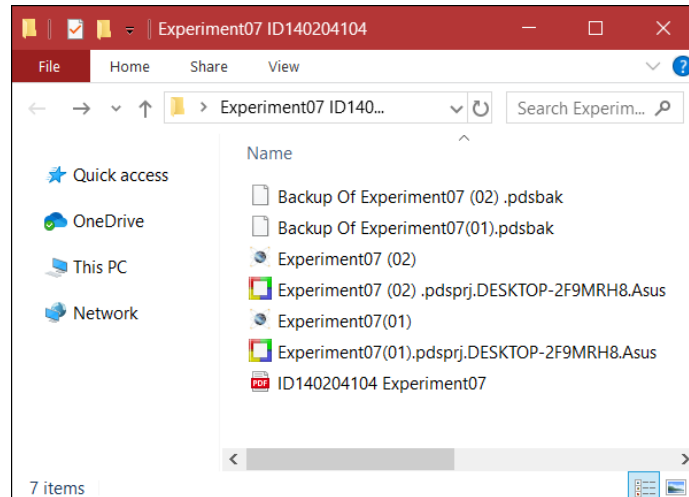

- ii. He would put his PDF report file inside that folder and the PDF file would be named as **ID140204104 Experiment07**. So, put your PDF file inside your folder and name the PDF file as **ID[YourStudentID][space]Experiment[ExperimentNo]**.

- iii. ID 140204104 would create two Proteus projects (as Experiment 07 has two problems) and after designing, save all Proteus files in the folder. He would name Proteus projects while creating as **Experiment07(01)** and **Experiment07(02)**. So, when creating a Proteus project, name the project as **Experiment[ExperimentNo]([ProblemNo])**.

- iv. After the circuits are done in Proteus and PDF report file is saved, his folder would have the following files. So, your folder should also have all files according to experiment.

- v. After all things are done, ID 140204104 would zip the folder. So, after you have the report and all Proteus files inside of your folder, zip it.

- vi. After that he would upload the zip file using the provided link. So, after you have your zipped folder, upload using the provided link.
