

5

Vectors

5.1 VECTORS

A vector is a quantity having both magnitude and direction such as force, velocity, acceleration, displacement etc.

5.2 ADDITION OF VECTORS

Let \vec{a} and \vec{b} be two given vectors
 $\vec{OA} = \vec{a}$ and $\vec{AB} = \vec{b}$ then vector \vec{OB} is called the sum of \vec{a} and \vec{b} .

Symbolically

$$\vec{OA} + \vec{AB} = \vec{OB}$$

$$\vec{a} + \vec{b} = \vec{OB}$$

5.3 RECTANGULAR RESOLUTION OF A VECTOR

Let OX, OY, OZ be the three rectangular axes. Let $\hat{i}, \hat{j}, \hat{k}$ be three unit vectors and parallel to three axes.

If $\vec{OP} = \vec{r}$ and the co-ordinates of P be (x, y, z)

$$\vec{OA} = x\hat{i}, \quad \vec{OB} = y\hat{j} \quad \text{and} \quad \vec{OC} = z\hat{k}$$

$$\vec{OP} = \vec{OF} + \vec{FP}$$

$$\Rightarrow \vec{OP} = (\vec{OA} + \vec{AF}) + \vec{FP}$$

$$\Rightarrow \vec{OP} = \vec{OA} + \vec{OB} + \vec{OC}$$

$$\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$$

$$\Rightarrow OP^2 = OF^2 + FP^2$$

$$= (OA^2 + AF^2) + FP^2 = OA^2 + OB^2 + OC^2 = x^2 + y^2 + z^2$$

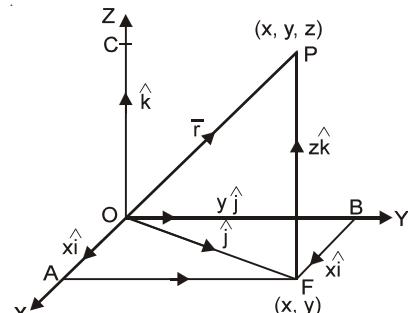

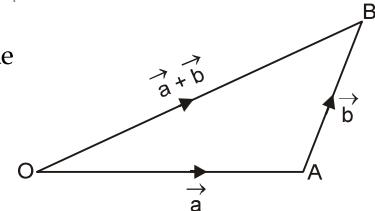

$$OP = \sqrt{x^2 + y^2 + z^2}$$

$$|\vec{r}| = \sqrt{x^2 + y^2 + z^2}$$

5.4 UNIT VECTOR

Let a vector be $x\hat{i} + y\hat{j} + z\hat{k}$.

$$\text{Unit vector} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{\sqrt{x^2 + y^2 + z^2}}$$

Example 1. If \vec{a} and \vec{b} be two unit vectors and α be the angle between them, then find the value of α such that $\vec{a} + \vec{b}$ is a unit vector. (Nagpur, University, Winter 2001)

Solution. Let $\vec{OA} = \vec{a}$ be a unit vector and $\vec{AB} = \vec{b}$ is another unit vector and α be the angle between \vec{a} and \vec{b} .

If $\vec{OB} = \vec{c} = \vec{a} + \vec{b}$ is also a unit vector then, we have

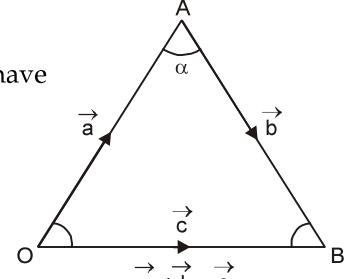

$$|\vec{OA}| = 1$$

$$|\vec{OB}| = 1$$

$$|\vec{OB}| = 1$$

OAB is an equilateral triangle.

Hence each angle of ΔOAB is $\frac{\pi}{3}$

Ans.

5.5 POSITION VECTOR OF A POINT

The position vector of a point A with respect to origin O is the vector \vec{OA} which is used to specify the position of A w.r.t. O .

To find \vec{AB} if the position vectors of the point A and point B are given.

If the position vectors of A and B are \vec{a} and \vec{b} . Let the origin be O .

$$\text{Then } \vec{OA} = \vec{a}, \quad \vec{OB} = \vec{b}$$

$$\vec{OA} + \vec{AB} = \vec{OB}$$

$$\vec{AB} = \vec{OB} - \vec{OA}$$

$$\Rightarrow \vec{AB} = \vec{b} - \vec{a}$$

\vec{AB} = Position vector of B – Position vector of A

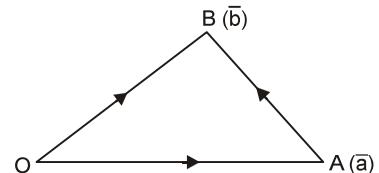

Example 2. If A and B are $(3, 4, 5)$ and $(6, 8, 9)$, find \vec{AB} .

Solution. \vec{AB} = Position vector of B – Position vector of A

$$= (6\hat{i} + 8\hat{j} + 9\hat{k}) - (3\hat{i} + 4\hat{j} + 5\hat{k})$$

$$= 3\hat{i} + 4\hat{j} + 4\hat{k}$$

Ans.

5.6 RATIO FORMULA

To find the position vector of the point which divides the line joining two given points.

Let A and B be two points and a point C divides AB in the ratio of $m : n$.

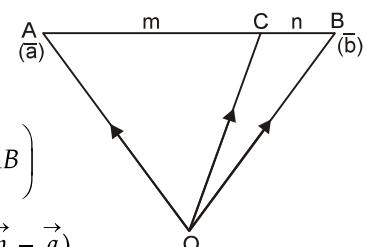

Let O be the origin, then

$$\vec{OA} = \vec{a}, \quad \text{and} \quad \vec{OB} = \vec{b}, \quad \vec{OC} = ?$$

$$\vec{OC} = \vec{OA} + \vec{AC}$$

$$= \vec{OA} + \frac{m}{m+n} \vec{AB} \quad \left(\because AC = \frac{m}{m+n} AB \right)$$

$$= \vec{a} + \frac{m}{m+n} \cdot (\vec{b} - \vec{a}) \quad (\because \vec{AB} = \vec{b} - \vec{a})$$

$$\vec{OC} = \frac{m \vec{b} + n \vec{a}}{m + n}$$

Cor. If $m = n = 1$, then C will be the mid-point, and

$$\vec{OC} = \frac{\vec{a} + \vec{b}}{2}$$

5.7 PRODUCT OF TWO VECTORS

The product of two vectors results in two different ways, the one is a number and the other is vector. So, there are two types of product of two vectors, namely scalar product and vector product. They are written as $\vec{a} \cdot \vec{b}$ and $\vec{a} \times \vec{b}$.

5.8 SCALAR, OR DOT PRODUCT

The scalar, or dot product of two vectors \vec{a} and \vec{b} is defined to be $|\vec{a}| |\vec{b}| \cos \theta$ i.e.,

scalar where θ is the angle between \vec{a} and \vec{b} .

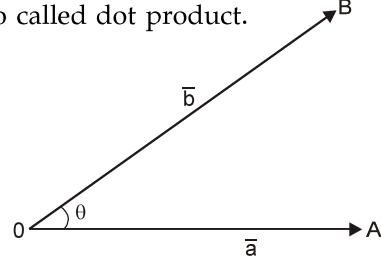

$$\text{Symbolically, } \vec{a} \cdot \vec{b} = |\vec{a}| |\vec{b}| \cos \theta$$

Due to a dot between \vec{a} and \vec{b} this product is also called dot product.

The scalar product is commutative

$$\text{To Prove. } \vec{a} \cdot \vec{b} = \vec{b} \cdot \vec{a}$$

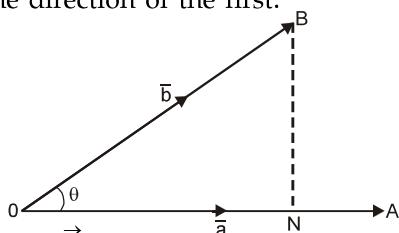

$$\begin{aligned} \text{Proof. } \vec{b} \cdot \vec{a} &= |\vec{b}| |\vec{a}| \cos (-\theta) \\ &= |\vec{a}| |\vec{b}| \cos \theta \\ &= \vec{a} \cdot \vec{b} \quad \text{Proved.} \end{aligned}$$

Geometrical interpretation. The scalar product of two vectors is the product of one vector and the length of the projection of the other in the direction of the first.

$$\text{Let } \vec{OA} = \vec{a} \text{ and } \vec{OB} = \vec{b}$$

$$\begin{aligned} \text{then } \vec{a} \cdot \vec{b} &= (OA) \cdot (OB) \cos \theta \\ &= OA \cdot OB \cdot \frac{ON}{OB} \\ &= OA \cdot ON \\ &= (\text{Length of } \vec{a}) (\text{projection of } \vec{b} \text{ along } \vec{a}) \end{aligned}$$

5.9 USEFUL RESULTS

$$\hat{i} \cdot \hat{i} = (1) (1) \cos 0^\circ = 1 \quad \text{Similarly, } \hat{j} \cdot \hat{j} = 1, \quad \hat{k} \cdot \hat{k} = 1$$

$$\hat{i} \cdot \hat{j} = (1) (1) \cos 90^\circ = 0 \quad \text{Similarly, } \hat{j} \cdot \hat{k} = 0, \quad \hat{k} \cdot \hat{i} = 0$$

Note. If the dot product of two vectors is zero then vectors are perpendicular to each other.

5.10 WORK DONE AS A SCALAR PRODUCT

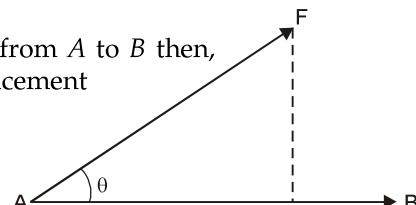

If a constant force F acting on a particle displaces it from A to B then,

Work done = (component of F along AB). Displacement

$$= F \cos \theta \cdot AB$$

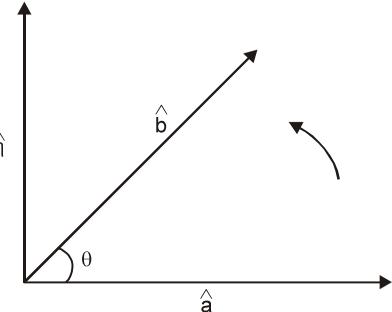

$$= \vec{F} \cdot \vec{AB}$$

$$\boxed{\text{Work done} = \text{Force} \cdot \text{Displacement}}$$

5.11 VECTOR PRODUCT OR CROSS PRODUCT

1. The vector, or cross product of two vectors \vec{a} and \vec{b} is defined to be a vector such that
- Its magnitude is $|\vec{a}| |\vec{b}| \sin \theta$, where θ is the angle between \vec{a} and \vec{b} .
 - Its direction is perpendicular to both vectors \vec{a} and \vec{b} .
 - It forms with a right handed system.

Let \hat{n} be a unit vector perpendicular to both the vectors \vec{a} and \vec{b} .

$$\vec{a} \times \vec{b} = |\vec{a}| |\vec{b}| \sin \theta \cdot \hat{n}$$

2. Useful results

Since $\hat{i}, \hat{j}, \hat{k}$ are three mutually perpendicular unit vectors, then

$$\hat{i} \times \hat{i} = \hat{j} \times \hat{j} = \hat{k} \times \hat{k} = 0$$

$$\hat{i} \times \hat{j} = -\hat{j} \times \hat{i} = \hat{k}$$

$$\hat{j} \times \hat{k} = -\hat{k} \times \hat{j} = \hat{i} \quad \text{and} \quad \hat{k} \times \hat{i} = -\hat{i} \times \hat{k} = \hat{j}$$

$$\hat{k} \times \hat{i} = -\hat{i} \times \hat{k} = \hat{j} \quad \hat{i} \times \hat{k} = -\hat{k} \times \hat{i} = \hat{j}$$

5.12 VECTOR PRODUCT EXPRESSED AS A DETERMINANT

$$\begin{aligned} \text{If } \vec{a} &= a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k} \\ \vec{b} &= b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k} \\ \vec{a} \times \vec{b} &= (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \times (b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}) \\ &= a_1 b_1 (\hat{i} \times \hat{i}) + a_1 b_2 (\hat{i} \times \hat{j}) + a_1 b_3 (\hat{i} \times \hat{k}) + a_2 b_1 (\hat{j} \times \hat{i}) + a_2 b_2 (\hat{j} \times \hat{j}) \\ &\quad + a_2 b_3 (\hat{j} \times \hat{k}) + a_3 b_1 (\hat{k} \times \hat{i}) + a_3 b_2 (\hat{k} \times \hat{j}) + a_3 b_3 (\hat{k} \times \hat{k}) \\ &= a_1 b_2 \hat{k} - a_1 b_3 \hat{j} - a_2 b_1 \hat{k} + a_2 b_3 \hat{i} + a_3 b_1 \hat{j} - a_3 b_2 \hat{i} \\ &= (a_2 b_3 - a_3 b_2) \hat{i} - (a_1 b_3 - a_3 b_1) \hat{j} + (a_1 b_2 - a_2 b_1) \hat{k} \\ &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix} \end{aligned}$$

5.13 AREA OF PARALLELOGRAM

Example 3. Find the area of a parallelogram whose adjacent sides are $\hat{i} - 2\hat{j} + 3\hat{k}$ and $2\hat{i} + \hat{j} - 4\hat{k}$.

Solution. Vector area of \parallel gm = $\begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -2 & 3 \\ 2 & 1 & -4 \end{vmatrix}$

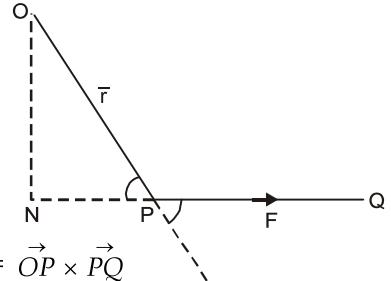

$$\begin{aligned}
 &= (8 - 3)\hat{i} - (-4 - 6)\hat{j} + (1 + 4)\hat{k} = 5\hat{i} + 10\hat{j} + 5\hat{k} \\
 \text{Area of parallelogram} &= \sqrt{(5)^2 + (10)^2 + (5)^2} = 5\sqrt{6} \quad \text{Ans.}
 \end{aligned}$$

5.14 MOMENT OF A FORCE

Let a force F (\vec{PQ}) act at a point P .

Moment of \vec{F} about O
 = Product of force F and perpendicular
 distance (ON. $\hat{\eta}$)

$$\begin{aligned}
 &= (PQ)(ON)(\hat{\eta}) = (PQ)(OP) \sin \theta (\hat{\eta}) = \vec{OP} \times \vec{PQ} \\
 \Rightarrow \quad \vec{M} &= \vec{r} \times \vec{F}
 \end{aligned}$$

5.15 ANGULAR VELOCITY

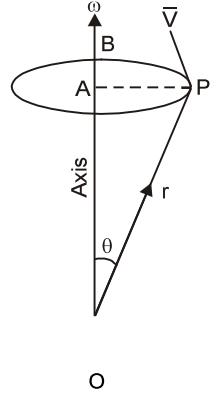

Let a rigid body be rotating about the axis OA with the angular velocity ω which is a vector and its magnitude is ω radians per second and its direction is parallel to the axis of rotation OA .

Let P be any point on the body such that $\vec{OP} = \vec{r}$ and $\angle AOP = \theta$ and $AP \perp OA$. Let the velocity of P be V .

Let $\hat{\eta}$ be a unit vector perpendicular to ω and \vec{r} .

$$\begin{aligned}
 \vec{\omega} \times \vec{r} &= (\omega r \sin \theta) \hat{\eta} = (\omega AP) \hat{\eta} = (\text{Speed of } P) \hat{\eta} \\
 &= \text{Velocity of } P \perp \text{ to } \vec{\omega} \text{ and } \vec{r}
 \end{aligned}$$

$$\text{Hence } \boxed{\vec{V} = \vec{\omega} \times \vec{r}}$$

5.16 SCALAR TRIPLE PRODUCT

Let \vec{a} , \vec{b} , \vec{c} be three vectors then their dot product is written as $\vec{a} \cdot (\vec{b} \times \vec{c})$ or $[\vec{a} \vec{b} \vec{c}]$.

If $\vec{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}$, $\vec{b} = b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}$, and $\vec{c} = c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k}$

$$\vec{a} \cdot (\vec{b} \times \vec{c}) = (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \cdot [(b_1 \hat{i} + b_2 \hat{j} + b_3 \hat{k}) \times (c_1 \hat{i} + c_2 \hat{j} + c_3 \hat{k})]$$

$$\begin{aligned}
 &= (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \cdot [(b_2 c_3 - b_3 c_2) \hat{i} + (b_3 c_1 - b_1 c_3) \hat{j} + (b_1 c_2 - b_2 c_1) \hat{k}] \\
 &= a_1 (b_2 c_3 - b_3 c_2) + a_2 (b_3 c_1 - b_1 c_3) + a_3 (b_1 c_2 - b_2 c_1)
 \end{aligned}$$

$$= \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

Similarly, $\vec{b} \cdot (\vec{c} \times \vec{a})$ and $\vec{c} \cdot (\vec{a} \times \vec{b})$ have the same value.

$$\therefore \vec{a} \cdot (\vec{b} \times \vec{c}) = \vec{b} \cdot (\vec{c} \times \vec{a}) = \vec{c} \cdot (\vec{a} \times \vec{b})$$

The value of the product depends upon the cyclic order of the vector, but is independent of the position of the dot and cross. These may be interchanged.

The value of the product changes if the order is non-cyclic.

Note. $\vec{a} \times (\vec{b} \cdot \vec{c})$ and $(\vec{a} \cdot \vec{b}) \times \vec{c}$ are meaningless.

5.17 GEOMETRICAL INTERPRETATION

The scalar triple product $\vec{a} \cdot (\vec{b} \times \vec{c})$ represents the volume of the parallelopiped having $\vec{a}, \vec{b}, \vec{c}$ as its co-terminous edges.

$$\vec{a} \cdot (\vec{b} \times \vec{c}) = \vec{a} \cdot \text{Area of } \parallel \text{gm } OBDC \hat{n}$$

= Area of $\parallel \text{gm } OBDC \times$ perpendicular distance between the parallel faces $OBDC$ and $AEFG$.

= Volume of the parallelopiped

Note. (1) If $\vec{a} \cdot (\vec{b} \times \vec{c}) = 0$, then $\vec{a}, \vec{b}, \vec{c}$ are coplanar.

(2) Volume of tetrahedron $\frac{1}{6} (\vec{a} \cdot \vec{b} \cdot \vec{c})$.

Example 4. Find the volume of parallelopiped if

$\vec{a} = -3 \hat{i} + 7 \hat{j} + 5 \hat{k}$, $\vec{b} = -3 \hat{i} + 7 \hat{j} - 3 \hat{k}$, and $\vec{c} = 7 \hat{i} - 5 \hat{j} - 3 \hat{k}$ are the three co-terminous edges of the parallelopiped.

Solution.

$$\begin{aligned} \text{Volume} &= \vec{a} \cdot (\vec{b} \times \vec{c}) \\ &= \begin{vmatrix} -3 & 7 & 5 \\ -3 & 7 & -3 \\ 7 & -5 & -3 \end{vmatrix} = -3(-21 - 15) - 7(9 + 21) + 5(15 - 49) \\ &= 108 - 210 - 170 = -272 \end{aligned}$$

Volume = 272 cube units.

Ans.

Example 5. Show that the volume of the tetrahedron having $\vec{A} + \vec{B}, \vec{B} + \vec{C}, \vec{C} + \vec{A}$ as concurrent edges is twice the volume of the tetrahedron having $\vec{A}, \vec{B}, \vec{C}$ as concurrent edges.

$$\begin{aligned} \text{Solution.} \text{ Volume of tetrahedron} &= \frac{1}{6} (\vec{A} + \vec{B}) \cdot [(\vec{B} + \vec{C}) \times (\vec{C} + \vec{A})] \\ &= \frac{1}{6} (\vec{A} + \vec{B}) \cdot [\vec{B} \times \vec{C} + \vec{B} \times \vec{A} + \vec{C} \times \vec{C} + \vec{C} \times \vec{A}] \quad [\vec{C} \times \vec{C} = 0] \\ &= \frac{1}{6} (\vec{A} + \vec{B}) \cdot (\vec{B} \times \vec{C} + \vec{B} \times \vec{A} + \vec{C} \times \vec{A}) \\ &= \frac{1}{6} [\vec{A} \cdot (\vec{B} \times \vec{C}) + \vec{A} \cdot (\vec{B} \times \vec{A}) + \vec{A} \cdot (\vec{C} \times \vec{A}) + \vec{B} \cdot (\vec{B} \times \vec{C}) + \vec{B} \cdot (\vec{B} \times \vec{A}) + \vec{B} \cdot (\vec{C} \times \vec{A})] \\ &= \frac{1}{6} [\vec{A} \cdot (\vec{B} \times \vec{C}) + \vec{B} \cdot (\vec{C} \times \vec{A})] = \frac{1}{3} \vec{A} \cdot (\vec{B} \times \vec{C}) \\ &= 2 \times \frac{1}{6} [\vec{A} \cdot \vec{B} \cdot \vec{C}] \\ &= 2 \text{ Volume of tetrahedron having } \vec{A}, \vec{B}, \vec{C} \text{ as concurrent edges.} \quad \text{Proved.} \end{aligned}$$

EXERCISE 5.1

1. Find the volume of the parallelopiped with adjacent sides.

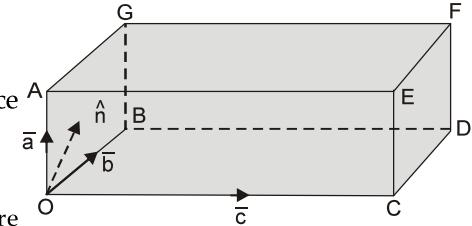

$$\vec{OA} = 3 \hat{i} - \hat{j}, \quad \vec{OB} = \hat{j} + 2 \hat{k}, \quad \text{and} \quad \vec{OC} = \hat{i} + 5 \hat{j} + 4 \hat{k}$$

extending from the origin of co-ordinates O . **Ans. 20**

2. Find the volume of the tetrahedron whose vertices are the points $A (2, -1, -3)$, $B (4, 1, 3)$

$C (3, 2, -1)$ and $D (1, 4, 2)$.

Ans. $7 \frac{1}{3}$

3. Choose y in order that the vectors $\vec{a} = 7\hat{i} + y\hat{j} + \hat{k}$, $\vec{b} = 3\hat{i} + 2\hat{j} + \hat{k}$, $\vec{c} = 5\hat{i} + 3\hat{j} + \hat{k}$ are linearly dependent. Ans. $y = 4$
4. Prove that

$$[\vec{a} + \vec{b}, \vec{b} + \vec{c}, \vec{c} + \vec{a}] = 2[\vec{a} \vec{b} \vec{c}]$$

5.18 COPLANARITY QUESTIONS

Example 6. Find the volume of tetrahedron having vertices

$$(-\hat{j} - \hat{k}), (4\hat{i} + 5\hat{j} + q\hat{k}), (3\hat{i} + 9\hat{j} + 4\hat{k}) \text{ and } 4(-\hat{i} + \hat{j} + \hat{k}).$$

Also find the value of q for which these four points are coplanar.

(Nagpur University, Summer 2004, 2003, 2002)

Solution. Let $\vec{A} = -\hat{j} - \hat{k}$, $\vec{B} = 4\hat{i} + 5\hat{j} + q\hat{k}$, $\vec{C} = 3\hat{i} + 9\hat{j} + 4\hat{k}$, $\vec{D} = 4(-\hat{i} + \hat{j} + \hat{k})$

$$\vec{AB} = \vec{B} - \vec{A} = 4\hat{i} + 5\hat{j} + q\hat{k} - (-\hat{j} - \hat{k}) = 4\hat{i} + 6\hat{j} + (q+1)\hat{k}$$

$$\vec{AC} = \vec{C} - \vec{A} = (3\hat{i} + 9\hat{j} + 4\hat{k}) - (-\hat{j} - \hat{k}) = 3\hat{i} + 10\hat{j} + 5\hat{k}$$

$$\vec{AD} = \vec{D} - \vec{A} = 4(-\hat{i} + \hat{j} + \hat{k}) - (-\hat{j} - \hat{k}) = -4\hat{i} + 5\hat{j} + 5\hat{k}$$

$$\text{Volume of the tetrahedron} = \frac{1}{6} [\vec{AB} \vec{AC} \vec{AD}]$$

$$= \frac{1}{6} \begin{vmatrix} 4 & 6 & q+1 \\ 3 & 10 & 5 \\ -4 & 5 & 5 \end{vmatrix} = \frac{1}{6} \{4(50-25) - 6(15+20) + (q+1)(15+40)\}$$

$$= \frac{1}{6} \{100 - 210 + 55(q+1)\} = \frac{1}{6} (-110 + 55 + 55q)$$

$$= \frac{1}{6} (-55 + 55q) = \frac{55}{6} (q-1)$$

If four points A, B, C and D are coplanar, then $(\vec{AB} \vec{AC} \vec{AD}) = 0$
i.e., Volume of the tetrahedron = 0

$$\Rightarrow \frac{55}{6} (q-1) = 0 \Rightarrow q = 1 \quad \text{Ans.}$$

Example 7. If four points whose position vectors are $\vec{a}, \vec{b}, \vec{c}, \vec{d}$ are coplanar, show that

$$[\vec{a} \vec{b} \vec{c}] = [\vec{a} \vec{d} \vec{b}] + [\vec{a} \vec{d} \vec{c}] + [\vec{d} \vec{b} \vec{c}] \quad (\text{Nagpur University, Summer 2005})$$

Solution. Let A, B, C, D be four points whose position vectors are $\vec{a}, \vec{b}, \vec{c}, \vec{d}$.

$$\vec{AD} = \vec{d} - \vec{a}, \quad \vec{BD} = \vec{d} - \vec{b} \quad \text{and} \quad \vec{CD} = \vec{d} - \vec{c}$$

If $\vec{AD}, \vec{BD}, \vec{CD}$ are coplanar, then

$$\vec{AD} \cdot (\vec{BD} \times \vec{CD}) = 0$$

$$\Rightarrow (\vec{d} - \vec{a}) \cdot [(\vec{d} - \vec{b}) \times (\vec{d} - \vec{c})] = 0$$

$$\Rightarrow (\vec{d} - \vec{a}) \cdot [\vec{d} \times \vec{d} - \vec{d} \times \vec{c} - \vec{b} \times \vec{d} + \vec{b} \times \vec{c}] = 0$$

$$\Rightarrow (\vec{d} - \vec{a}) \cdot [-\vec{d} \times \vec{c} - \vec{b} \times \vec{d} + \vec{b} \times \vec{c}] = 0$$

$$\Rightarrow -\vec{d} \cdot (\vec{d} \times \vec{c}) - \vec{d} \cdot (\vec{b} \times \vec{d}) + \vec{d} \cdot (\vec{b} \times \vec{c}) + \vec{a} \cdot (\vec{d} \times \vec{c}) + \vec{a} \cdot (\vec{b} \times \vec{a}) - \vec{a} \cdot (\vec{b} \times \vec{c}) = 0$$

$$\Rightarrow -0 + 0 + [\vec{d} \vec{b} \vec{c}] + [\vec{d} \vec{d} \vec{c}] + [\vec{d} \vec{b} \vec{d}] - [\vec{a} \vec{b} \vec{c}] = 0$$

$$\Rightarrow [\vec{a} \vec{b} \vec{c}] = [\vec{a} \vec{b} \vec{d}] + [\vec{a} \vec{d} \vec{c}] + [\vec{d} \vec{b} \vec{c}] \quad \text{Proved.}$$

EXERCISE 5.2

1. Determine
- λ
- such that

$$\bar{a} = \hat{i} + \hat{j} + \hat{k}, \bar{b} = 2\hat{i} - 4\hat{k}, \text{ and } \bar{c} = \hat{i} + \lambda\hat{j} + 3\hat{k} \text{ are coplanar.} \quad \text{Ans. } \lambda = 5/3$$

2. Show that the four points

$$-6\hat{i} + 3\hat{j} + 2\hat{k}, 3\hat{i} - 2\hat{j} + 4\hat{k}, 5\hat{i} + 7\hat{j} + 3\hat{k} \text{ and } -13\hat{i} + 17\hat{j} - \hat{k} \text{ are coplanar.}$$

3. Find the constant
- a
- such that the vectors

$$2\hat{i} - \hat{j} + \hat{k}, \hat{i} + 2\hat{j} - 3\hat{k}, \text{ and } 3\hat{i} + a\hat{j} + 5\hat{k} \text{ are coplanar.} \quad \text{Ans. } -4$$

4. Prove that four points

$$4\hat{i} + 5\hat{j} + \hat{k}, -(\hat{j} + \hat{k}), 3\hat{i} + 9\hat{j} + 4\hat{k}, 4(-\hat{i} + \hat{j} + \hat{k}) \text{ are coplanar.}$$

5. If the vectors
- \vec{a}
- ,
- \vec{b}
- and
- \vec{c}
- are coplanar, show that

$$\begin{vmatrix} \vec{a} & \vec{b} & \vec{c} \\ \vec{a} \cdot \vec{a} & \vec{a} \cdot \vec{b} & \vec{a} \cdot \vec{c} \\ \vec{b} \cdot \vec{a} & \vec{b} \cdot \vec{b} & \vec{b} \cdot \vec{c} \end{vmatrix} = 0$$

5.19 VECTOR PRODUCT OF THREE VECTORS

(A.M.I.E.T.E., Summer, 2004, 2000)

Let \vec{a} , \vec{b} and \vec{c} be three vectors then their vector product is written as $\vec{a} \times (\vec{b} \times \vec{c})$.

$$\text{Let } \vec{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k},$$

$$\vec{b} = b_1\hat{i} + b_2\hat{j} + b_3\hat{k},$$

$$\vec{c} = c_1\hat{i} + c_2\hat{j} + c_3\hat{k}$$

$$\begin{aligned} \vec{a} \times (\vec{b} \times \vec{c}) &= (a_1\hat{i} + a_2\hat{j} + a_3\hat{k}) \times (b_1\hat{i} + b_2\hat{j} + b_3\hat{k}) \times (c_1\hat{i} + c_2\hat{j} + c_3\hat{k}) \\ &= (a_1\hat{i} + a_2\hat{j} + a_3\hat{k}) \times [(b_2c_3 - b_3c_2)\hat{i} + (b_3c_1 - b_1c_3)\hat{j} + (b_1c_2 - b_2c_1)\hat{k}] \\ &= [a_2(b_1c_2 - b_2c_1) - a_3(b_3c_1 - b_1c_3)]\hat{i} + [a_3(b_2c_3 - b_3c_2) - a_1(b_1c_2 - b_2c_1)]\hat{j} \\ &\quad + [a_1(b_3c_1 - b_1c_3) - a_2(b_2c_3 - b_3c_2)]\hat{k} \\ &= (a_1c_1 + a_2c_2 + a_3c_3)(b_1\hat{i} + b_2\hat{j} + b_3\hat{k}) - (a_1b_1 + a_2b_2 + a_3b_3)(c_1\hat{i} + c_2\hat{j} + c_3\hat{k}) \\ &= (\vec{a} \cdot \vec{c})\vec{b} - (\vec{a} \cdot \vec{b})\vec{c}. \end{aligned} \quad \text{Ans.}$$

Example 8. Prove that :

$$\vec{a} \times (\vec{b} \times \vec{c}) + \vec{b} \times (\vec{c} \times \vec{a}) + \vec{c} \times (\vec{a} \times \vec{b}) = 0 \quad (\text{Nagpur University, Winter 2008})$$

Solution. Here, we have

$$\begin{aligned} \vec{a} \times (\vec{b} \times \vec{c}) + \vec{b} \times (\vec{c} \times \vec{a}) + \vec{c} \times (\vec{a} \times \vec{b}) &= [(\vec{a} \cdot \vec{c})\vec{b} - (\vec{a} \cdot \vec{b})\vec{c}] + [(\vec{b} \cdot \vec{a})\vec{c} - (\vec{b} \cdot \vec{c})\vec{a}] + [(\vec{c} \cdot \vec{b})\vec{a} - (\vec{c} \cdot \vec{a})\vec{b}] \\ &= [(\vec{b} \cdot \vec{a})\vec{c} - (\vec{a} \cdot \vec{b})\vec{c}] + [(\vec{c} \cdot \vec{b})\vec{a} - (\vec{b} \cdot \vec{c})\vec{a}] + [(\vec{a} \cdot \vec{c})\vec{b} - (\vec{c} \cdot \vec{a})\vec{b}] \\ &= [(\vec{a} \cdot \vec{b})\vec{c} - (\vec{a} \cdot \vec{b})\vec{c}] + [(\vec{b} \cdot \vec{c})\vec{a} - (\vec{b} \cdot \vec{c})\vec{a}] + [(\vec{c} \cdot \vec{a})\vec{b} - (\vec{c} \cdot \vec{a})\vec{b}] \\ &= 0 + 0 + 0 = 0 \end{aligned} \quad \text{Proved.}$$

Example 9. Prove that :

$$\hat{i} \times (\hat{a} \times \hat{i}) + \hat{j} \times (\hat{a} \times \hat{j}) + \hat{k} \times (\hat{a} \times \hat{k}) = 2\hat{a} \quad (\text{Nagpur University, Winter 2003})$$

Solution. Let $\vec{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$

$$\begin{aligned}
\text{Now, L.H.S.} &= \hat{i} \times (\vec{a} \times \hat{i}) + \hat{j} \times (\vec{a} \times \hat{j}) + \hat{k} \times (\vec{a} \times \hat{k}) \\
&= \hat{i} \times \left[(a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \times \hat{i} \right] + \hat{j} \times \left[(a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \times \hat{j} \right] + \\
&\quad \hat{k} \times \left[(a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \times \hat{k} \right] \\
&= \hat{i} \times \left[a_1 (\hat{i} \times \hat{i}) + a_2 (\hat{j} \times \hat{i}) + a_3 (\hat{k} \times \hat{i}) \right] + \hat{j} \times \left[a_1 (\hat{i} \times \hat{j}) + a_2 (\hat{j} \times \hat{j}) + a_3 (\hat{k} \times \hat{j}) \right] \\
&\quad + \hat{k} \times \left[a_1 (\hat{i} \times \hat{k}) + a_2 (\hat{j} \times \hat{k}) + a_3 (\hat{k} \times \hat{k}) \right] \\
&= \hat{i} \times \left[0 - a_2 \hat{k} + a_3 \hat{j} \right] + \hat{j} \times \left[a_1 \hat{k} + 0 - a_3 \hat{i} \right] + \hat{k} \times \left[-a_1 \hat{j} + a_2 \hat{i} + 0 \right] \\
&= -a_2 (\hat{i} \times \hat{k}) + a_3 (\hat{i} \times \hat{j}) + a_1 (\hat{j} \times \hat{k}) - a_3 (\hat{j} \times \hat{i}) - a_1 (\hat{k} \times \hat{j}) + a_2 (\hat{k} \times \hat{i}) \\
&= a_2 \hat{j} + a_3 \hat{k} + a_1 \hat{i} + a_3 \hat{k} + a_1 \hat{i} + a_2 \hat{j} = 2a_1 \hat{i} + 2a_2 \hat{j} + 2a_3 \hat{k} \\
&= 2 (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) = 2 \vec{a}
\end{aligned}$$

Proved.

Example 10. Show that for any scalar λ , the vectors \vec{x}, \vec{y} given by

$$\vec{x} = \lambda \vec{a} + \frac{q(\vec{a} \times \vec{b})}{a^2}, \quad \vec{y} = \frac{(1-p)\lambda}{q} \vec{a} - \frac{p(\vec{a} \times \vec{b})}{a^2}$$

satisfy the equations

$$p\vec{x} + q\vec{y} = \vec{a} \text{ and } \vec{x} \times \vec{y} = \vec{b}. \quad (\text{Nagpur University, Winter 2004})$$

Solution. The given equations are

$$p\vec{x} + q\vec{y} = \vec{a} \quad \dots(1)$$

$$\vec{x} \times \vec{y} = \vec{b} \quad \dots(2)$$

Multiplying equation (1) vectorially by \vec{x} , we get

$$\begin{aligned}
\vec{x} \times (p\vec{x} + q\vec{y}) &= \vec{x} \times \vec{a} \\
p(\vec{x} \times \vec{x}) + q(\vec{x} \times \vec{y}) &= \vec{x} \times \vec{a} \\
q \times (\vec{x} \times \vec{y}) &= \vec{x} \times \vec{a}, \quad \text{as } \vec{x} \times \vec{x} = 0 \\
\vec{x} \times \vec{a} &= \vec{q}\vec{b}, \quad [\text{From (2) } \vec{x} \times \vec{y} = \vec{b}] \quad \dots(3)
\end{aligned}$$

Multiplying (3) vectorially by \vec{a} , we have

$$\begin{aligned}
\vec{a} \times (\vec{x} \times \vec{a}) &= \vec{a} \times q \vec{b} \\
(\vec{a} \cdot \vec{a}) \vec{x} - (\vec{a} \cdot \vec{x}) \vec{a} &= q(\vec{a} \times \vec{b}) \\
a^2 \vec{x} - (\vec{a} \cdot \vec{x}) \vec{a} &= q(\vec{a} \times \vec{b}) \quad \Rightarrow \quad a^2 \vec{x} = (\vec{a} \cdot \vec{x}) \vec{a} + q(\vec{a} \times \vec{b}) \\
\vec{x} &= \frac{(\vec{a} \cdot \vec{x}) \vec{a}}{a^2} + \frac{q(\vec{a} \times \vec{b})}{a^2}
\end{aligned}$$

$$\vec{x} = \lambda \vec{a} + \frac{q(\vec{a} \times \vec{b})}{a^2} \quad \text{where } \lambda = \frac{\vec{a} \cdot \vec{x}}{a^2}$$

Substituting the value of \vec{x} in (1), we get $p \left\{ \lambda \vec{a} + \frac{q(\vec{a} \times \vec{b})}{a^2} \right\} + q \vec{y} = \vec{a}$

$$q \vec{y} = \vec{a} - p \left\{ \lambda \vec{a} + \frac{q(\vec{a} \times \vec{b})}{a^2} \right\}$$

$$\vec{y} = \frac{(1 - p\lambda) \vec{a}}{q} - \frac{p(\vec{a} \times \vec{b})}{a^2}$$

Ans.

EXERCISE 5.3

1. Show that $\vec{a} \times (\vec{b} \times \vec{a}) = (\vec{a} \times \vec{b}) \times \vec{a}$
 2. Write the correct answer

(a) $(\vec{A} \times \vec{B}) \times \vec{C}$ lies in the plane of

$$(i) \vec{A} \text{ and } \vec{B} \quad (ii) \vec{B} \text{ and } \vec{C} \quad (iii) \vec{C} \text{ and } \vec{A}$$

Ans. (ii)

(b) The value of $\vec{a} \cdot (\vec{b} + \vec{c}) \times (\vec{a} + \vec{b} + \vec{c})$ is

$$(i) \text{Zero} \quad (ii) [\vec{a}, \vec{b}, \vec{c}] + [\vec{b}, \vec{c}, \vec{a}] \quad (iii) [\vec{a}, \vec{b}, \vec{c}] \quad (iv) \text{None of these}$$

Ans. (ii)

5.20 SCALAR PRODUCT OF FOUR VECTORS

Prove the identity

$$(\vec{a} \times \vec{b}) \cdot (\vec{c} \times \vec{d}) = (\vec{a} \cdot \vec{c})(\vec{b} \cdot \vec{d}) - (\vec{a} \cdot \vec{d})(\vec{b} \cdot \vec{c})$$

Proof. $(\vec{a} \times \vec{b}) \cdot (\vec{c} \times \vec{d}) = (\vec{a} \times \vec{b}) \cdot \vec{r}$

$$\begin{aligned} &= \vec{a} \cdot (\vec{b} \times \vec{r}) \text{ dot and cross can be interchanged. Put } \vec{c} \times \vec{d} = \vec{r} \\ &= \vec{a} \cdot [\vec{b} \times (\vec{c} \times \vec{d})] = \vec{a} \cdot [(\vec{b} \cdot \vec{d}) \vec{c} - (\vec{b} \cdot \vec{c}) \vec{d}] \\ &= (\vec{a} \cdot \vec{c})(\vec{b} \cdot \vec{d}) - (\vec{a} \cdot \vec{d})(\vec{b} \cdot \vec{c}) \\ &= \begin{vmatrix} \vec{a} \cdot \vec{c} & \vec{a} \cdot \vec{d} \\ \vec{b} \cdot \vec{c} & \vec{b} \cdot \vec{d} \end{vmatrix} \end{aligned}$$

Proved.

EXERCISE 5.4

1. If $\vec{a} = 2i + 3j - k$, $\vec{b} = -i + 2j - 4k$, $\vec{c} = i + j + k$, find $(\vec{a} \times \vec{b}) \cdot (\vec{a} \times \vec{c})$. Ans. -74
 2. Prove that $(\vec{a} \times \vec{b}) \cdot (\vec{a} \times \vec{c}) = a^2(\vec{b} \cdot \vec{c}) - (\vec{a} \cdot \vec{b})(\vec{a} \cdot \vec{c})$.

5.21 VECTOR PRODUCT OF FOUR VECTORS

Let \vec{a} , \vec{b} , \vec{c} and \vec{d} be four vectors then their vector product is written as

$$(\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d})$$

$$\begin{aligned} \text{Now, } (\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d}) &= \vec{r} \times (\vec{c} \times \vec{d}) & [\text{Put } \vec{a} \times \vec{b} = \vec{r}] \\ &= (\vec{r} \cdot \vec{d}) \vec{c} - (\vec{r} \cdot \vec{c}) \vec{d} \end{aligned}$$

$$\begin{aligned}
 &= [(\vec{a} \times \vec{b}) \cdot \vec{d}] \vec{c} - [(\vec{a} \times \vec{b}) \cdot \vec{c}] \vec{d} \\
 &= [\vec{a} \vec{b} \vec{d}] \vec{c} - [\vec{a} \vec{b} \vec{c}] \vec{d}
 \end{aligned}$$

$\therefore (\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d})$ lies in the plane of \vec{c} and \vec{d} (1)

$$\begin{aligned}
 \text{Again, } (\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d}) &= (\vec{a} \times \vec{b}) \times \vec{s} & [\text{Put } \vec{c} \times \vec{d} = \vec{s}] \\
 &= -\vec{s} \times (\vec{a} \times \vec{b}) = -(\vec{s} \cdot \vec{b}) \vec{a} + (\vec{s} \cdot \vec{a}) \vec{b} \\
 &= -[(\vec{c} \times \vec{d}) \cdot \vec{b}] \vec{a} + [(\vec{c} \times \vec{d}) \cdot \vec{a}] \vec{b} = -[(\vec{b} \vec{c} \vec{d}) \vec{a} + (\vec{a} \vec{c} \vec{d}) \vec{b}]
 \end{aligned}$$

$\therefore (\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d})$ lies in the plane of \vec{a} and \vec{b} (2)

Geometrical interpretation : From (1) and (2) we conclude that $(\vec{a} \times \vec{b}) \times (\vec{c} \times \vec{d})$ is a vector parallel to the line of intersection of the plane containing \vec{a} , \vec{b} and plane containing \vec{c} , \vec{d} .

Example 11. Show that

$$(\vec{B} \times \vec{C}) \times (\vec{A} \times \vec{D}) + (\vec{C} \times \vec{A}) \times (\vec{B} \times \vec{D}) + (\vec{A} \times \vec{B}) \times (\vec{C} \times \vec{D}) = -2(\vec{A} \vec{B} \vec{C} \vec{D})$$

$$\begin{aligned}
 \text{Solution. L.H.S.} &= (\vec{B} \times \vec{C}) \times (\vec{A} \times \vec{D}) + (\vec{C} \times \vec{A}) \times (\vec{B} \times \vec{D}) + (\vec{A} \times \vec{B}) \times (\vec{C} \times \vec{D}) \\
 &= [(\vec{B} \vec{C} \vec{D}) \vec{A} - (\vec{B} \vec{C} \vec{A}) \vec{D}] + [(\vec{C} \vec{A} \vec{D}) \vec{B} - (\vec{C} \vec{A} \vec{B}) \vec{D}] + [(-\vec{B} \vec{C} \vec{D}) \vec{A} + (\vec{A} \vec{C} \vec{D}) \vec{B}] \\
 &= (\vec{B} \vec{C} \vec{D}) \vec{A} - (\vec{B} \vec{C} \vec{D}) \vec{A} + (\vec{C} \vec{A} \vec{D}) \vec{B} + (\vec{A} \vec{C} \vec{D}) \vec{B} - (\vec{B} \vec{C} \vec{A}) \vec{D} - (\vec{C} \vec{A} \vec{B}) \vec{D} \\
 &= -(\vec{A} \vec{C} \vec{D}) \vec{B} + (\vec{A} \vec{C} \vec{D}) \vec{B} - (\vec{A} \vec{B} \vec{C}) \vec{D} - (\vec{A} \vec{B} \vec{C}) \vec{D} \\
 &= -2(\vec{A} \vec{B} \vec{C} \vec{D}) = \text{R.H.S.}
 \end{aligned}$$

Proved.

EXERCISE 5.5

Show that:

- $(\vec{b} \times \vec{c}) \times (\vec{c} \times \vec{a}) = \vec{c} (\vec{a} \vec{b} \vec{c})$ when $(\vec{a} \vec{b} \vec{c})$ stands for scalar triple product.
- $[\vec{b} \times \vec{c}, \vec{c} \times \vec{a}, \vec{a} \times \vec{b}] = [\vec{a} \vec{b} \vec{c}]^2$
- $\vec{d} [\vec{a} \times \{\vec{b} \times (\vec{c} \times \vec{d})\}] = [(\vec{b} \cdot \vec{d}) [\vec{a} \cdot (\vec{c} \times \vec{d})]]$
- $\vec{a} [\vec{a} \times [\vec{a} \times (\vec{a} \times \vec{b})]] = a^2 (\vec{b} \times \vec{a})$
- $[(\vec{a} \times \vec{b}) \times (\vec{a} \times \vec{c})] \cdot \vec{d} = (\vec{a} \cdot \vec{d}) [\vec{a} \vec{b} \vec{c}]$
- $2a^2 = \left| \vec{a} \times \hat{i} \right|^2 + \left| \vec{a} \times \hat{j} \right|^2 + \left| \vec{a} \times \hat{k} \right|^2$
- $\vec{a} \times \vec{b} = [(\hat{i} \times \vec{a}) \cdot \vec{b}] \hat{i} + [(\hat{j} \times \vec{a}) \cdot \vec{b}] \hat{j} + [(\hat{k} \times \vec{a}) \cdot \vec{b}] \hat{k}$
- $\vec{p} \times [(\vec{a} \times \vec{q}) \times (\vec{b} \times \vec{r})] + \vec{q} \times [(\vec{a} \times \vec{r}) \times (\vec{b} \times \vec{p})] + \vec{r} \times [(\vec{a} \times \vec{p}) \times (\vec{b} \times \vec{q})] = 0$

5.22 VECTOR FUNCTION

If vector \vec{r} is a function of a scalar variable t , then we write

$$\vec{r} = \vec{r}(t)$$

If a particle is moving along a curved path then the position vector \vec{r} of the particle is a function of t . If the component of $\vec{r}(t)$ along x -axis, y -axis, z -axis are $f_1(t), f_2(t), f_3(t)$ respectively. Then,

$$\vec{r}(t) = f_1(t)\hat{i} + f_2(t)\hat{j} + f_3(t)\hat{k}$$

5.23 DIFFERENTIATION OF VECTORS

Let O be the origin and P be the position of a moving particle at time t .

$$\text{Let } \vec{OP} = \vec{r}$$

Let Q be the position of the particle at the time $t + \delta t$ and the position vector of Q is $\vec{OQ} = \vec{r} + \delta \vec{r}$

$$\begin{aligned}\vec{PQ} &= \vec{OQ} - \vec{OP} \\ &= (\vec{r} + \delta \vec{r}) - \vec{r} = \delta \vec{r}\end{aligned}$$

$\frac{\delta \vec{r}}{\delta t}$ is a vector. As $\delta t \rightarrow 0$, Q tends to P and the chord becomes the tangent at P .

We define $\frac{d \vec{r}}{dt} = \lim_{\delta t \rightarrow 0} \frac{\delta \vec{r}}{\delta t}$, then

$\frac{d \vec{r}}{dt}$ is a vector in the direction of the tangent at P .

$\frac{d \vec{r}}{dt}$ is also called the differential coefficient of \vec{r} with respect to 't'.

Similarly, $\frac{d^2 \vec{r}}{dt^2}$ is the second order derivative of \vec{r} .

$\frac{d \vec{r}}{dt}$ gives the velocity of the particle at P , which is along the tangent to its path. Also $\frac{d^2 \vec{r}}{dt^2}$ gives the acceleration of the particle at P .

5.24 FORMULAE OF DIFFERENTIATION

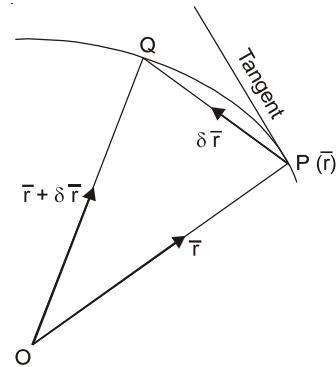

$$(i) \frac{d}{dt}(\vec{F} + \vec{G}) = \frac{d\vec{F}}{dt} + \frac{d\vec{G}}{dt} \quad (ii) \frac{d}{dt}(\vec{F}\phi) = \frac{d\vec{F}}{dt}\phi + \vec{F}\frac{d\phi}{dt} \quad (\text{U.P. I semester, Dec. 2005})$$

$$(iii) \frac{d}{dt}(\vec{F} \cdot \vec{G}) = \vec{F} \cdot \frac{d\vec{G}}{dt} + \frac{d\vec{F}}{dt} \cdot \vec{G} \quad (iv) \frac{d}{dt}(\vec{F} \times \vec{G}) = \vec{F} \times \frac{d\vec{G}}{dt} + \frac{d\vec{F}}{dt} \times \vec{G}$$

$$(v) \frac{d}{dt}[\vec{a} \vec{b} \vec{c}] = \left[\frac{d\vec{a}}{dt} \vec{b} \vec{c} \right] + \left[\vec{a} \frac{d\vec{b}}{dt} \vec{c} \right] + \left[\vec{a} \vec{b} \frac{d\vec{c}}{dt} \right]$$

$$(vi) \frac{d}{dt}[\vec{a} \times (\vec{b} \times \vec{c})] = \frac{d\vec{a}}{dt} \times (\vec{b} \times \vec{c}) + \vec{a} \times \left(\frac{d\vec{b}}{dt} \times \vec{c} \right) + \vec{a} \times \left(\vec{b} \times \frac{d\vec{c}}{dt} \right)$$

The order of the functions \vec{F}, \vec{G} is not to be changed.

Example 12. A particle moves along the curve $\vec{r} = (t^3 - 4t)\hat{i} + (t^2 + 4t)\hat{j} + (8t^2 - 3t^3)\hat{k}$, where t is the time. Find the magnitude of the tangential components of its acceleration at $t = 2$.

(Nagpur University, Summer 2005)

Solution. We have, $\vec{r} = (t^3 - 4t)\hat{i} + (t^2 + 4t)\hat{j} + (8t^2 - 3t^3)\hat{k}$

$$\text{Velocity} = \frac{d\vec{r}}{dt} = (3t^2 - 4)\hat{i} + (2t + 4)\hat{j} + (16t - 9t^2)\hat{k}$$

At

$$t = 2, \quad \text{Velocity} = 8\hat{i} + 8\hat{j} - 4\hat{k}$$

$$\text{Acceleration} = \vec{a} = \frac{d^2\vec{r}}{dt^2} = 6t\hat{i} + 2\hat{j} + (16 - 18t)\hat{k}$$

At

$$t = 2 \quad \vec{a} = 12\hat{i} + 2\hat{j} - 20\hat{k}$$

The direction of velocity is along tangent.

So the tangent vector is velocity.

$$\text{Unit tangent vector, } \hat{T} = \frac{\vec{v}}{|\vec{v}|} = \frac{8\hat{i} + 8\hat{j} - 4\hat{k}}{\sqrt{64 + 64 + 16}} = \frac{8\hat{i} + 8\hat{j} - 4\hat{k}}{12} = \frac{2\hat{i} + 2\hat{j} - \hat{k}}{3}$$

Tangential component of acceleration, $a_t = \vec{a} \cdot \hat{T}$

$$= (12\hat{i} + 2\hat{j} - 20\hat{k}) \cdot \frac{2\hat{i} + 2\hat{j} - \hat{k}}{3} = \frac{24 + 4 + 20}{3} = \frac{48}{3} = 16 \text{ Ans.}$$

Example 13. If $\frac{d\vec{a}}{dt} = \vec{u} \times \vec{a}$ and $\frac{d\vec{b}}{dt} = \vec{u} \times \vec{b}$ then prove that $\frac{d}{dt}[\vec{a} \times \vec{b}] = \vec{u} \times (\vec{a} \times \vec{b})$

(M.U. 2009)

Solution. We have,

$$\begin{aligned} \frac{d}{dt}[\vec{a} \times \vec{b}] &= \vec{a} \times \frac{d\vec{b}}{dt} + \frac{d\vec{a}}{dt} \times \vec{b} = \vec{a} \times (\vec{u} \times \vec{b}) + (\vec{u} \times \vec{a}) \times \vec{b} \\ &= \vec{a} \times (\vec{u} \times \vec{b}) - \vec{b} \times (\vec{u} \times \vec{a}) \\ &= (\vec{a} \cdot \vec{b})\vec{u} - (\vec{a} \cdot \vec{u})\vec{b} - [(\vec{b} \cdot \vec{a})\vec{u} - (\vec{b} \cdot \vec{u})\vec{a}] \\ &\quad \text{(Vector triple product)} \\ &= (\vec{a} \cdot \vec{b})\vec{u} - (\vec{u} \cdot \vec{a})\vec{b} - (\vec{a} \cdot \vec{b})\vec{u} + (\vec{u} \cdot \vec{b})\vec{a} \\ &= (\vec{u} \cdot \vec{b})\vec{a} - (\vec{u} \cdot \vec{a})\vec{b} \\ &= \vec{u} \times (\vec{a} \times \vec{b}) \end{aligned}$$

Proved.

Example 14. Find the angle between the surface $x^2 + y^2 + z^2 = 9$ and $z = x^2 + y^2 - 3$ at $(2, -1, 2)$.

(M.D.U. Dec. 2009)

Solution. Here, we have

$$x^2 + y^2 + z^2 = 9 \quad \dots(1)$$

$$z = x^2 + y^2 - 3 \quad \dots(2)$$

Normal to (1) $\eta_1 = \nabla(x^2 + y^2 + z^2 - 9)$

$$= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 9) = 2x\hat{i} + 2y\hat{j} + 2z\hat{k}$$

Normal to (1) at $(2, -1, 2)$, $\eta_1 = 4\hat{i} - 2\hat{j} + 4\hat{k}$

... (3)

$$\begin{aligned} \text{Normal to (2), } \eta_2 &= \nabla(z - x^2 - y^2 + 3) \\ &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (z - x^2 - y^2 + 3) = -2x\hat{i} - 2y\hat{j} + \hat{k} \end{aligned} \quad \dots(4)$$

$$\begin{aligned} \text{Normal to (2) at } (2, -1, 2), \eta_2 &= -4\hat{i} + 2\hat{j} + \hat{k} \\ \eta_1 \cdot \eta_2 &= |\eta_1| |\eta_2| \cos \theta \\ \cos \theta &= \frac{\eta_1 \cdot \eta_2}{|\eta_1| |\eta_2|} = \frac{(4\hat{i} - 2\hat{j} + 4\hat{k}) \cdot (-4\hat{i} + 2\hat{j} + \hat{k})}{|4\hat{i} - 2\hat{j} + 4\hat{k}| |-4\hat{i} + 2\hat{j} + \hat{k}|} = \frac{-16 - 4 + 4}{\sqrt{16+4+16} \sqrt{16+4+1}} \\ &= \frac{-16}{6\sqrt{21}} = \frac{-8}{3\sqrt{21}} \\ \theta &= \cos^{-1} \left(\frac{-8}{3\sqrt{21}} \right) \end{aligned}$$

$$\text{Hence the angle between (1) and (2) } \cos^{-1} \left(\frac{-8}{3\sqrt{21}} \right) \quad \text{Ans}$$

EXERCISE 5.6

1. The coordinates of a moving particle are given by $x = 4t - \frac{t^2}{2}$ and $y = 3 + 6t - \frac{t^3}{6}$. Find the velocity and acceleration of the particle when $t = 2$ secs. **Ans.** 4.47, 2.24

2. A particle moves along the curve

$$x = 2t^2, \quad y = t^2 - 4t \quad \text{and} \quad z = 3t - 5$$

where t is the time. Find the components of its velocity and acceleration at time $t = 1$, in the direction $\hat{i} - 3\hat{j} + 2\hat{k}$. **(Nagpur, Summer 2001)** **Ans.** $\frac{8\sqrt{14}}{7}, -\frac{\sqrt{14}}{7}$

3. Find the unit tangent and unit normal vector at $t = 2$ on the curve $x = t^2 - 1$, $y = 4t - 3$, $z = 2t^2 - 6t$ where t is any variable. **Ans.** $\frac{1}{3}(2\hat{i} + 2\hat{j} + \hat{k}), \frac{1}{3\sqrt{5}}(2\hat{i} + 2\hat{k})$

4. Prove that $\frac{d}{dt}(\vec{F} \times \vec{G}) = \vec{F} \times \frac{d\vec{G}}{dt} + \frac{d\vec{F}}{dt} \times \vec{G}$

5. Find the angle between the tangents to the curve $\vec{r} = t^2\hat{i} + 2t\hat{j} - t^3\hat{k}$, at the points $t = \pm 1$.

$$\text{Ans. } \cos^{-1} \left(\frac{9}{17} \right)$$

6. If the surface $5x^2 - 2byz = 9x$ be orthogonal to the surface $4x^2y + z^3 = 4$ at the point $(1, -1, 2)$ then b is equal to

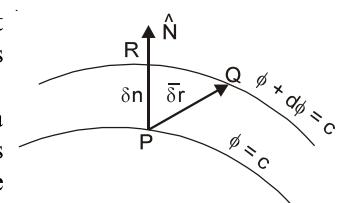

- (a) 0 (b) 1 (c) 2 (d) 3 **(AMIETE, Dec. 2009)** **Ans.** (b)

5.25 SCALAR AND VECTOR POINT FUNCTIONS

Point function. A variable quantity whose value at any point in a region of space depends upon the position of the point, is called a *point function*. There are two types of point functions.

(i) **Scalar point function.** If to each point $P(x, y, z)$ of a region R in space there corresponds a unique scalar $f(P)$, then f is called a scalar point function. *For example*, the temperature distribution in a heated body, density of a body and potential due to gravity are the examples of a scalar point function.

(ii) **Vector point function.** If to each point $P(x, y, z)$ of a region R in space there corresponds a unique vector $f(P)$, then f is called a *vector point function*. The velocity of a moving fluid, gravitational force are the examples of vector point function.

(U.P., I Semester, Winter 2000)

Vector Differential Operator Del i.e. ∇

The vector differential operator Del is denoted by ∇ . It is defined as

$$\nabla = \hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z}$$

5.26 GRADIENT OF A SCALAR FUNCTION

If $\phi(x, y, z)$ be a scalar function then $\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z}$ is called the gradient of the scalar function ϕ .

And is denoted by $\text{grad } \phi$.

Thus,

$$\begin{aligned} \text{grad } \phi &= \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \\ \text{grad } \phi &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi(x, y, z) \\ \text{grad } \phi &= \nabla \phi \quad (\nabla \text{ is read del or nebla}) \end{aligned}$$

5.27 GEOMETRICAL MEANING OF GRADIENT, NORMAL

(U.P. Ist Semester, Dec 2006)

If a surface $\phi(x, y, z) = c$ passes through a point P . The value of the function at each point on the surface is the same as at P . Then such a surface is called a *level surface* through P . For example, If $\phi(x, y, z)$ represents potential at the point P , then *equipotential surface* $\phi(x, y, z) = c$ is a *level surface*.

Two level surfaces can not intersect.

Let the level surface pass through the point P at which the value of the function is ϕ . Consider another level surface passing through Q , where the value of the function is $\phi + d\phi$.

Let \vec{r} and $\vec{r} + \delta\vec{r}$ be the position vector of P and Q then $\vec{PQ} = \delta\vec{r}$

$$\begin{aligned} \nabla\phi \cdot d\vec{r} &= \left(\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\ &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz = d\phi \end{aligned} \quad \dots(1)$$

If Q lies on the level surface of P , then $d\phi = 0$

Equation (1) becomes $\nabla\phi \cdot dr = 0$. Then $\nabla\phi$ is \perp to $d\vec{r}$ (tangent).

Hence, $\nabla\phi$ is **normal** to the surface $\phi(x, y, z) = c$

Let $\nabla\phi = |\nabla\phi| \hat{N}$, where \hat{N} is a unit normal vector. Let δn be the perpendicular distance between two level surfaces through P and Q . Then the rate of change of ϕ in the direction of the

normal to the surface through P is $\frac{\partial \phi}{\partial n}$.

$$\begin{aligned} \frac{d\phi}{dn} &= \lim_{\delta n \rightarrow 0} \frac{\delta\phi}{\delta n} = \lim_{\delta n \rightarrow 0} \frac{\nabla\phi \cdot d\vec{r}}{\delta n} \\ &= \lim_{\delta n \rightarrow 0} \frac{|\nabla\phi| \hat{N} \cdot d\vec{r}}{\delta n} \\ &= \lim_{\delta n \rightarrow 0} \frac{|\nabla\phi| \delta n}{\delta n} = |\nabla\phi| \end{aligned}$$

$$\left\{ \begin{array}{l} \hat{N} \cdot \vec{dr} = |\hat{N}| |\vec{dr}| \cos \theta \\ = |\vec{dr}| \cos \theta = \delta n \end{array} \right.$$

$$\therefore |\nabla\phi| = \frac{\partial\phi}{\partial n}$$

Hence, gradient ϕ is a vector normal to the surface $\phi = c$ and has a magnitude equal to the rate of change of ϕ along this normal.

5.28 NORMAL AND DIRECTIONAL DERIVATIVE

(i) **Normal.** If $\phi(x, y, z) = c$ represents a family of surfaces for different values of the constant c . On differentiating ϕ , we get $d\phi = 0$

$$\text{But } d\phi = \nabla\phi \cdot d\vec{r} \text{ so } \nabla\phi \cdot d\vec{r} = 0$$

The scalar product of two vectors $\nabla\phi$ and $d\vec{r}$ being zero, $\nabla\phi$ and $d\vec{r}$ are perpendicular to each other. $d\vec{r}$ is in the direction of tangent to the given surface.

Thus $\nabla\phi$ is a vector *normal* to the surface $\phi(x, y, z) = c$.

(ii) **Directional derivative.** The component of $\nabla\phi$ in the direction of a vector \vec{d} is equal to $\nabla\phi \cdot \hat{d}$ and is called the directional derivative of ϕ in the direction of \vec{d} .

$$\frac{\partial\phi}{\partial r} = \lim_{\delta r \rightarrow 0} \frac{\delta\phi}{\delta r} \quad \text{where, } \delta r = PQ$$

$\frac{\partial\phi}{\partial r}$ is called the *directional derivative* of ϕ at P in the direction of PQ .

Let a unit vector along PQ be \hat{N}' .

$$\frac{\delta n}{\delta r} = \cos \theta \Rightarrow \delta r = \frac{\delta n}{\cos \theta} = \frac{\delta n}{\hat{N} \cdot \hat{N}'} \quad \dots(1)$$

$$\begin{aligned} \text{Now } \frac{\partial\phi}{\partial r} &= \lim_{\delta r \rightarrow 0} \left[\frac{\frac{\delta\phi}{\delta n}}{\frac{\delta n}{\hat{N} \cdot \hat{N}'}} \right] = \hat{N} \cdot \hat{N}' \frac{\partial\phi}{\partial n} && \left[\text{From (1), } \delta r = \frac{\delta n}{\hat{N} \cdot \hat{N}'} \right] \\ &= \hat{N}' \cdot \hat{N} |\nabla\phi| &= \hat{N}' \cdot \nabla\phi & (\because \hat{N}' \cdot \nabla\phi = |\nabla\phi|) \end{aligned}$$

Hence, $\frac{\partial\phi}{\partial r}$, directional derivative is the component of $\nabla\phi$ in the direction \hat{N}' .

$$\frac{\partial\phi}{\partial r} = \hat{N}' \cdot \nabla\phi = |\nabla\phi| \cos \theta \leq |\nabla\phi|$$

Hence, $\nabla\phi$ is the maximum rate of change of ϕ .

Example 15. For the vector field (i) $\vec{A} = m\hat{i}$ and (ii) $\vec{A} = m\vec{r}$. Find $\nabla \cdot \vec{A}$ and $\nabla \times \vec{A}$.
Draw the sketch in each case. (Gujarat, I Semester, Jan. 2009)

Solution. (i) Vector $\vec{A} = m\hat{i}$ is represented in the figure (i).

$$(ii) \vec{A} = m\vec{r} \text{ is represented in the figure (ii).}$$

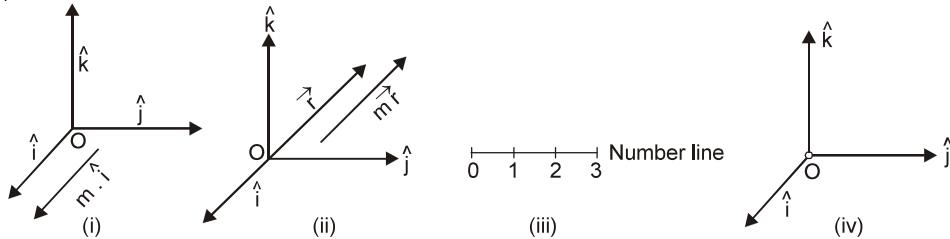

$$(iii) \nabla \cdot \vec{A} = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x\hat{i} + y\hat{j} + z\hat{k}) = 1 + 1 + 1 = 3$$

$$\nabla \cdot \vec{A} = 3 \text{ is represented on the number line at 3.}$$

$$(iv) \nabla \times \vec{A} = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (x\hat{i} + y\hat{j} + z\hat{k})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x & y & z \end{vmatrix} = 0$$

are represented in the adjoining figure.

Example 16. If $\phi = 3x^2y - y^3z^2$; find $\text{grad } \phi$ at the point $(1, -2, -1)$.

(AMIETE, June 2009, U.P., I Semester, Dec. 2006)

Solution. $\text{grad } \phi = \nabla \phi$

$$\begin{aligned} &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (3x^2y - y^3z^2) \\ &= \hat{i} \frac{\partial}{\partial x} (3x^2y - y^3z^2) + \hat{j} \frac{\partial}{\partial y} (3x^2y - y^3z^2) + \hat{k} \frac{\partial}{\partial z} (3x^2y - y^3z^2) \\ &= \hat{i} (6xy) + \hat{j} (3x^2 - 3y^2z^2) + \hat{k} (-2y^3z) \end{aligned}$$

$$\begin{aligned} \text{grad } \phi \text{ at } (1, -2, -1) &= \hat{i} (6)(1)(-2) + \hat{j} [(3)(1) - 3(4)(1)] + \hat{k} (-2)(-8)(-1) \\ &= -12\hat{i} - 9\hat{j} - 16\hat{k} \end{aligned}$$

Ans.

Example 17. If $u = x + y + z$, $v = x^2 + y^2 + z^2$, $w = yz + zx + xy$ prove that $\text{grad } u$, $\text{grad } v$ and $\text{grad } w$ are coplanar vectors.

[U.P., I Semester, 2001]

Solution. We have,

$$\begin{aligned} \text{grad } u &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x + y + z) = \hat{i} + \hat{j} + \hat{k} \\ \text{grad } v &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2) = 2x\hat{i} + 2y\hat{j} + 2z\hat{k} \\ \text{grad } w &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (yz + zx + xy) = \hat{i}(z + y) + \hat{j}(z + x) + \hat{k}(y + x) \end{aligned}$$

[For vectors to be coplanar, their scalar triple product is 0]

$$\begin{aligned} \text{Now, } \text{grad } u \cdot (\text{grad } v \times \text{grad } w) &= \begin{vmatrix} 1 & 1 & 1 \\ 2x & 2y & 2z \\ z + y & z + x & y + x \end{vmatrix} = 2 \begin{vmatrix} 1 & 1 & 1 \\ x & y & z \\ z + y & z + x & y + x \end{vmatrix} \\ &= 2 \begin{vmatrix} 1 & 1 & 1 \\ x + y + z & x + y + z & x + y + z \\ z + y & z + x & y + x \end{vmatrix} \quad [\text{Applying } R_2 \rightarrow R_2 + R_3] \\ &= 2(x + y + z) \begin{vmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ y + z & z + x & x + y \end{vmatrix} = 0 \end{aligned}$$

Since the scalar product of $\text{grad } u$, $\text{grad } v$ and $\text{grad } w$ are zero, hence these vectors are coplanar vectors. Proved.

Example 18. Find the directional derivative of $x^2y^2z^2$ at the point $(1, 1, -1)$ in the direction of the tangent to the curve $x = e^t$, $y = \sin 2t + 1$, $z = 1 - \cos t$ at $t = 0$.

(Nagpur University, Summer 2005)

Solution. Let $\phi = x^2 y^2 z^2$

Directional Derivative of ϕ

$$= \nabla\phi = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 y^2 z^2)$$

$$\nabla\phi = 2xy^2z^2 \hat{i} + 2yx^2z^2 \hat{j} + 2zx^2y^2 \hat{k}$$

Directional Derivative of ϕ at $(1, 1, -1)$

$$\begin{aligned} &= 2(1)(1)^2(-1)^2 \hat{i} + 2(1)(1)^2(-1)^2 \hat{j} + 2(-1)(1)^2(1)^2 \hat{k} \\ &= 2 \hat{i} + 2 \hat{j} - 2 \hat{k} \end{aligned} \quad \dots(1)$$

$$\vec{r} = x \hat{i} + y \hat{j} + z \hat{k} = e^t \hat{i} + (\sin 2t + 1) \hat{j} + (1 - \cos t) \hat{k}$$

$$\text{Tangent vector, } \vec{T} = \frac{d \vec{r}}{dt} = e^t \hat{i} + 2 \cos 2t \hat{j} + \sin t \hat{k}$$

$$\text{Tangent(at } t = 0) = e^0 \hat{i} + 2(\cos 0) \hat{j} + (\sin 0) \hat{k} = \hat{i} + 2 \hat{j} \quad \dots(2)$$

$$\begin{aligned} \text{Required directional derivative along tangent} &= (2 \hat{i} + 2 \hat{j} - 2 \hat{k}) \frac{(\hat{i} + 2 \hat{j})}{\sqrt{1+4}} \\ &\quad \text{[From (1), (2)]} \end{aligned}$$

$$= \frac{2+4+0}{\sqrt{5}} = \frac{6}{\sqrt{5}} \quad \text{Ans.}$$

Example 19. Find the unit normal to the surface $xy^3z^2 = 4$ at $(-1, -1, 2)$. (M.U. 2008)

Solution. Let $\phi(x, y, z) = xy^3z^2 = 4$

We know that $\nabla\phi$ is the vector normal to the surface $\phi(x, y, z) = c$.

$$\text{Normal vector} = \nabla\phi = \hat{i} \frac{\partial\phi}{\partial x} + \hat{j} \frac{\partial\phi}{\partial y} + \hat{k} \frac{\partial\phi}{\partial z}$$

$$\text{Now} \quad = \hat{i} \frac{\partial}{\partial x}(xy^3z^2) + \hat{j} \frac{\partial}{\partial y}(xy^3z^2) + \hat{k} \frac{\partial}{\partial z}(xy^3z^2)$$

$$\Rightarrow \text{Normal vector} = y^3z^2 \hat{i} + 3xy^2z^2 \hat{j} + 2xy^3z \hat{k}$$

$$\text{Normal vector at } (-1, -1, 2) = -4 \hat{i} - 12 \hat{j} + 4 \hat{k}$$

Unit vector normal to the surface at $(-1, -1, 2)$.

$$= \frac{\nabla\phi}{|\nabla\phi|} = \frac{-4 \hat{i} - 12 \hat{j} + 4 \hat{k}}{\sqrt{16+144+16}} = -\frac{1}{\sqrt{11}} (\hat{i} + 3 \hat{j} - \hat{k}) \quad \text{Ans.}$$

Example 20. Find the rate of change of $\phi = xyz$ in the direction normal to the surface $x^2y + y^2x + yz^2 = 3$ at the point $(1, 1, 1)$. (Nagpur University, Summer 2001)

Solution. Rate of change of $\phi = \Delta \phi$

$$= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x y z) = \hat{i} y z + \hat{j} x z + \hat{k} x y$$

Rate of change of ϕ at $(1, 1, 1) = \hat{i} + \hat{j} + \hat{k}$

Normal to the surface $\Psi = x^2y + y^2x + yz^2 - 3$ is given as -

$$\begin{aligned}\nabla \Psi &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2y + y^2x + yz^2 - 3) \\ &= \hat{i}(2xy + y^2) + \hat{j}(x^2 + 2xy + z^2) + \hat{k}2yz \\ (\nabla \Psi)_{(1, 1, 1)} &= 3\hat{i} + 4\hat{j} + 2\hat{k} \\ \text{Unit normal} &= \frac{3\hat{i} + 4\hat{j} + 2\hat{k}}{\sqrt{9+16+4}}\end{aligned}$$

$$\text{Required rate of change of } \phi = (\hat{i} + \hat{j} + \hat{k}) \cdot \frac{(3\hat{i} + 4\hat{j} + 2\hat{k})}{\sqrt{9+16+4}} = \frac{3+4+2}{\sqrt{29}} = \frac{9}{\sqrt{29}} \quad \text{Ans.}$$

Example 21. Find the constants m and n such that the surface $mx^2 - 2nyz = (m+4)x$ will be orthogonal to the surface $4x^2y + z^3 = 4$ at the point $(1, -1, 2)$.

(M.D.U. Dec. 2009, Nagpur University, Summer 2002)

Solution. The point $P(1, -1, 2)$ lies on both surfaces. As this point lies in

$$\begin{aligned}mx^2 - 2nyz &= (m+4)x, \text{ so we have} \\ m - 2n(-2) &= (m+4) \\ \Rightarrow m + 4n &= m + 4 \Rightarrow n = 1 \\ \therefore \text{Let } \phi_1 &= mx^2 - 2yz - (m+4)x \text{ and } \phi_2 = 4x^2y + z^3 - 4 \\ \text{Normal to } \phi_1 &= \nabla \phi_1 \\ &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) [mx^2 - 2yz - (m+4)x] \\ &= \hat{i}(2mx - m - 4) - 2z\hat{j} - 2y\hat{k}\end{aligned}$$

$$\text{Normal to } \phi_1 \text{ at } (1, -1, 2) = \hat{i}(2m - m - 4) - 4\hat{j} + 2\hat{k} = (m - 4)\hat{i} - 4\hat{j} + 2\hat{k}$$

$$\begin{aligned}\text{Normal to } \phi_2 &= \nabla \phi_2 \\ &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (4x^2y + z^3 - 4) = \hat{i}8xy + 4x^2\hat{j} + 3z^2\hat{k}\end{aligned}$$

$$\text{Normal to } \phi_2 \text{ at } (1, -1, 2) = -8\hat{i} + 4\hat{j} + 12\hat{k}$$

Since ϕ_1 and ϕ_2 are orthogonal, then normals are perpendicular to each other.

$$\nabla \phi_1 \cdot \nabla \phi_2 = 0$$

$$\begin{aligned}\Rightarrow [(m-4)\hat{i} - 4\hat{j} + 2\hat{k}] \cdot [-8\hat{i} + 4\hat{j} + 12\hat{k}] &= 0 \\ \Rightarrow -8(m-4) - 16 + 24 &= 0 \\ \Rightarrow m-4 &= -2+3 \Rightarrow m=5\end{aligned}$$

Hence $m=5$, $n=1$ Ans.

Example 22. Find the values of constants λ and μ so that the surfaces $\lambda x^2 - \mu yz = (\lambda+2)x$, $4x^2y + z^3 = 4$ intersect orthogonally at the point $(1, -1, 2)$.

(AMIETE, II Sem., Dec. 2010, June 2009)

Solution. Here, we have

$$\lambda x^2 - \mu yz = (\lambda+2)x \quad \dots(1)$$

$$4x^2y + z^3 = 4 \quad \dots(2)$$

$$\begin{aligned}
 \text{Normal to the surface (1), } \nabla &= \nabla [\lambda x^2 - \mu yz - (\lambda + 2)x] \\
 &= \left[\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right] [\lambda x^2 - \mu yz - (\lambda + 2)x] \\
 &= \hat{i} (2\lambda x - \lambda - 2) + \hat{j} (-\mu z) + \hat{k} (-\mu y) \\
 \text{Normal at } (1, -1, 2) &= \hat{i} (2\lambda - \lambda - 2) - \hat{j} (-2\mu) + \hat{k} \mu \\
 &= \hat{i} (\lambda - 2) + \hat{j} z (2\mu) + \hat{k} \mu
 \end{aligned} \tag{3}$$

Normal at the surface (2)

$$\begin{aligned}
 &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (4x^2 y + z^3 - 4) \\
 &= \hat{i} (8x^2 y) + \hat{j} (4x^2) + \hat{k} (3z^2)
 \end{aligned}$$

$$\text{Normal at the point } (1, -1, 2) = -8\hat{i} + 4\hat{j} + 12\hat{k} \tag{4}$$

Since (3) and (4) are orthogonal so

$$\begin{aligned}
 &[\hat{i} (\lambda - 2) + \hat{j} (2\mu) + \hat{k} \mu] \cdot [-8\hat{i} + 4\hat{j} + 12\hat{k}] = 0 \\
 -8(\lambda - 2) + 4(2\mu) + 12\mu &= 0 \Rightarrow -8\lambda + 16 + 8\mu + 12\mu = 0 \\
 -8\lambda - 20\mu + 16 &= 0 \Rightarrow 4(-2\lambda + 5\mu + 4) = 0 \\
 -2\lambda + 5\mu + 4 &= 0 \Rightarrow 2\lambda - 5\mu = 4
 \end{aligned} \tag{5}$$

Point $(1, -1, 2)$ will satisfy (1)

$$\therefore \lambda(1)^2 - \mu(-1)(2) = (\lambda + 2)(1) \Rightarrow \lambda + 2\mu = \lambda + 2 \Rightarrow \mu = 1$$

Putting $\mu = 1$ in (5), we get

$$2\lambda - 5 = 4 \Rightarrow \lambda = \frac{9}{2}$$

$$\text{Hence } \lambda = \frac{9}{2} \text{ and } \mu = 1 \quad \text{Ans.}$$

Example 23. Find the angle between the surfaces $x^2 + y^2 + z^2 = 9$ and $z = x^2 + y^2 - 3$ at the point $(2, -1, 2)$. (Nagpur University, Summer 2002)

Solution. Normal on the surface $(x^2 + y^2 + z^2 - 9 = 0)$

$$\nabla \phi = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 9) = (2x\hat{i} + 2y\hat{j} + 2z\hat{k})$$

$$\text{Normal at the point } (2, -1, 2) = 4\hat{i} - 2\hat{j} + 4\hat{k} \tag{1}$$

$$\begin{aligned}
 \text{Normal on the surface } (z = x^2 + y^2 - 3) &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 - z - 3) \\
 &= 2x\hat{i} + 2y\hat{j} - \hat{k}
 \end{aligned}$$

$$\text{Normal at the point } (2, -1, 2) = 4\hat{i} - 2\hat{j} - \hat{k} \tag{2}$$

Let θ be the angle between normals (1) and (2).

$$\begin{aligned}
 (4\hat{i} - 2\hat{j} + 4\hat{k}) \cdot (4\hat{i} - 2\hat{j} - \hat{k}) &= \sqrt{16 + 4 + 16} \sqrt{16 + 4 + 1} \cos \theta \\
 16 + 4 - 4 &= 6\sqrt{21} \cos \theta \Rightarrow 16 = 6\sqrt{21} \cos \theta
 \end{aligned}$$

$$\Rightarrow \cos \theta = \frac{8}{3\sqrt{21}} \Rightarrow \theta = \cos^{-1} \frac{8}{3\sqrt{21}} \quad \text{Ans.}$$

Example 24. Find the directional derivative of $\frac{1}{r}$ in the direction \hat{r} where $\hat{r} = \hat{x} + \hat{y} + \hat{z}$.
(Nagpur University, Summer 2004, U.P., I Semester, Winter 2005, 2002)

Solution. Here, $\phi(x, y, z) = \frac{1}{r} = \frac{1}{\sqrt{x^2 + y^2 + z^2}} = (x^2 + y^2 + z^2)^{-\frac{1}{2}}$

$$\begin{aligned} \text{Now } \nabla \left(\frac{1}{r} \right) &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2)^{-\frac{1}{2}} \\ &= \frac{\partial}{\partial x} (x^2 + y^2 + z^2)^{-\frac{1}{2}} \hat{i} + \frac{\partial}{\partial y} (x^2 + y^2 + z^2)^{-\frac{1}{2}} \hat{j} + \frac{\partial}{\partial z} (x^2 + y^2 + z^2)^{-\frac{1}{2}} \hat{k} \\ &= \left\{ -\frac{1}{2} (x^2 + y^2 + z^2)^{-\frac{3}{2}} 2x \right\} \hat{i} + \left\{ -\frac{1}{2} (x^2 + y^2 + z^2)^{-\frac{3}{2}} 2y \right\} \hat{j} + \left\{ -\frac{1}{2} (x^2 + y^2 + z^2)^{-\frac{3}{2}} 2z \right\} \hat{k} \\ &= \frac{-(x \hat{i} + y \hat{j} + z \hat{k})}{(x^2 + y^2 + z^2)^{3/2}} \end{aligned} \quad \dots(1)$$

and $\hat{r} = \text{unit vector in the direction of } \hat{x} + \hat{y} + \hat{z}$

$$= \frac{\hat{x} + \hat{y} + \hat{z}}{\sqrt{x^2 + y^2 + z^2}} \quad \dots(2)$$

So, the required directional derivative

$$\begin{aligned} &= \nabla \phi \cdot \hat{r} = -\frac{\hat{x} + \hat{y} + \hat{z}}{(x^2 + y^2 + z^2)^{3/2}} \cdot \frac{\hat{x} + \hat{y} + \hat{z}}{(x^2 + y^2 + z^2)^{1/2}} = \frac{x^2 + y^2 + z^2}{(x^2 + y^2 + z^2)^2} \quad [\text{From (1), (2)}] \\ &= \frac{1}{x^2 + y^2 + z^2} = \frac{1}{r^2} \quad \text{Ans.} \end{aligned}$$

Example 25. Find the direction in which the directional derivative of $\phi(x, y) = \frac{x^2 + y^2}{xy}$ at

$(1, 1)$ is zero and hence find out component of velocity of the vector $\hat{r} = (t^3 + 1) \hat{i} + t^2 \hat{j}$ in the same direction at $t = 1$.
(Nagpur University, Winter 2000)

Solution. Directional derivative $= \nabla \phi = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \left(\frac{x^2 + y^2}{xy} \right)$

$$\begin{aligned} &= \hat{i} \left[\frac{xy \cdot 2x - (x^2 + y^2)y}{x^2 y^2} \right] + \hat{j} \left[\frac{xy \cdot 2y - x(y^2 + x^2)}{x^2 y^2} \right] \\ &= \hat{i} \left[\frac{x^2 y - y^3}{x^2 y^2} \right] + \hat{j} \left[\frac{xy^2 - x^3}{x^2 y^2} \right] \end{aligned}$$

Directional Derivative at $(1, 1) = \hat{i} 0 + \hat{j} 0 = 0$

Since $(\nabla \phi)_{(1, 1)} = 0$, the directional derivative of ϕ at $(1, 1)$ is zero in any direction.

Again $\hat{r} = (t^3 + 1) \hat{i} + t^2 \hat{j}$

$$\text{Velocity, } \vec{v} = \frac{d\vec{r}}{dt} = 3t^2 \hat{i} + 2t \hat{j}$$

$$\text{Velocity at } t = 1 \text{ is } = 3 \hat{i} + 2 \hat{j}$$

The component of velocity in the same direction of velocity

$$= (3 \hat{i} + 2 \hat{j}) \cdot \left(\frac{3 \hat{i} + 2 \hat{j}}{\sqrt{9+4}} \right) = \frac{9+4}{\sqrt{13}} = \sqrt{13}$$

Ans.

Example 26. Find the directional derivative of $\phi(x, y, z) = x^2 y z + 4 x z^2$ at $(1, -2, 1)$ in the direction of $2 \hat{i} - \hat{j} - 2 \hat{k}$. Find the greatest rate of increase of ϕ .

(Uttarakhand, I Semester, Dec. 2006)

Solution. Here, $\phi(x, y, z) = x^2 y z + 4 x z^2$

$$\text{Now, } \nabla \phi = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 y z + 4 x z^2)$$

$$= (2xyz + 4z^2) \hat{i} + (x^2 z) \hat{j} + (x^2 y + 8xz) \hat{k}$$

$$\begin{aligned} \nabla \phi \text{ at } (1, -2, 1) &= \{2(1)(-2)(1) + 4(1)^2\} \hat{i} + (1 \times 1) \hat{j} + \{1(-2) + 8(1)(1)\} \hat{k} \\ &= (-4 + 4) \hat{i} + \hat{j} + (-2 + 8) \hat{k} = \hat{j} + 6 \hat{k} \end{aligned}$$

$$\text{Let } \hat{a} = \text{unit vector} = \frac{2 \hat{i} - \hat{j} - 2 \hat{k}}{\sqrt{4+1+4}} = \frac{1}{3}(2 \hat{i} - \hat{j} - 2 \hat{k})$$

So, the required directional derivative at $(1, -2, 1)$

$$= \nabla \phi \cdot \hat{a} = (\hat{j} + 6 \hat{k}) \cdot \frac{1}{3}(2 \hat{i} - \hat{j} - 2 \hat{k}) = \frac{1}{3}(-1 - 12) = \frac{-13}{3}$$

$$\begin{aligned} \text{Greatest rate of increase of } \phi &= \left| \hat{j} + 6 \hat{k} \right| = \sqrt{1+36} \\ &= \sqrt{37} \end{aligned}$$

Ans.

Example 27. Find the directional derivative of the function $\phi = x^2 - y^2 + 2z^2$ at the point $P(1, 2, 3)$ in the direction of the line PQ where Q is the point $(5, 0, 4)$.

(AMIETE, Dec. 20010, Nagpur University, Summer 2008, U.P., I Sem., Winter 2000)

Solution. Directional derivative = $\vec{\nabla} \phi$

$$= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 - y^2 + 2z^2) = 2x \hat{i} - 2y \hat{j} + 4z \hat{k}$$

$$\text{Directional Derivative at the point } P(1, 2, 3) = 2 \hat{i} - 4 \hat{j} + 12 \hat{k} \quad \dots(1)$$

$$\overline{PQ} = \overline{Q} - \overline{P} = (5, 0, 4) - (1, 2, 3) = (4, -2, 1) \quad \dots(2)$$

$$\text{Directional Derivative along } PQ = (2 \hat{i} - 4 \hat{j} + 12 \hat{k}) \cdot \frac{(4 \hat{i} - 2 \hat{j} + \hat{k})}{\sqrt{16+4+1}} \text{ [From (1) and (2)]}$$

$$= \frac{8 + 8 + 12}{\sqrt{21}} = \frac{28}{\sqrt{21}} \quad \text{Ans.}$$

Example 28. For the function $\phi(x, y) = \frac{x}{x^2 + y^2}$, find the magnitude of the directional derivative along a line making an angle 30° with the positive x -axis at $(0, 2)$.

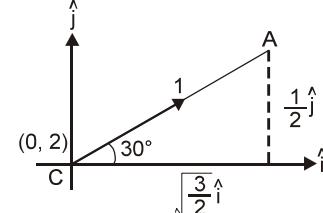

(A.M.I.E.T.E., Winter 2002)

Solution. Directional derivative = $\vec{\nabla}\phi$

$$\begin{aligned} &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \frac{x}{x^2 + y^2} = \hat{i} \left(\frac{1}{x^2 + y^2} - \frac{x(2x)}{(x^2 + y^2)^2} \right) - \hat{j} \frac{x(2y)}{(x^2 + y^2)^2} \\ &= \hat{i} \frac{y^2 - x^2}{(x^2 + y^2)^2} - \hat{j} \frac{2xy}{(x^2 + y^2)^2} \end{aligned}$$

Directional derivative at the point $(0, 2)$

$$= \hat{i} \frac{4-0}{(0+4)^2} - \hat{j} \frac{2(0)(2)}{(0+4)^2} = \frac{\hat{i}}{4}$$

Directional derivative at the point $(0, 2)$ in the direction \vec{CA} i.e. $\left(\frac{\sqrt{3}}{2} \hat{i} + \frac{1}{2} \hat{j} \right)$

$$\begin{aligned} &= \frac{\hat{i}}{4} \cdot \left(\frac{\sqrt{3}}{2} \hat{i} + \frac{1}{2} \hat{j} \right) \quad \left\{ \begin{aligned} \vec{CA} &= \vec{OB} + \vec{BA} = \hat{i} \cos 30^\circ + \hat{j} \sin 30^\circ \\ &= \left(\frac{\sqrt{3}}{2} \hat{i} + \frac{1}{2} \hat{j} \right) \end{aligned} \right\} \\ &= \frac{\sqrt{3}}{8} \end{aligned}$$

Ans.

Example 29. Find the directional derivative of \vec{V}^2 , where $\vec{V} = xy^2 \hat{i} + zy^2 \hat{j} + xz^2 \hat{k}$, at the point $(2, 0, 3)$ in the direction of the outward normal to the sphere $x^2 + y^2 + z^2 = 14$ at the point $(3, 2, 1)$. (A.M.I.E.T.E., Dec. 2007)

Solution. $V^2 = \vec{V} \cdot \vec{V}$

$$= (xy^2 \hat{i} + zy^2 \hat{j} + xz^2 \hat{k}) \cdot (xy^2 \hat{i} + zy^2 \hat{j} + xz^2 \hat{k}) = x^2y^4 + z^2y^4 + x^2z^4$$

Directional derivative = $\vec{\nabla}V^2$

$$\begin{aligned} &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2y^4 + z^2y^4 + x^2z^4) \\ &= (2xy^4 + 2xz^4) \hat{i} + (4x^2y^3 + 4y^3z^2) \hat{j} + (2y^4z + 4x^2z^3) \hat{k} \end{aligned}$$

Directional derivative at $(2, 0, 3) = (0 + 2 \times 2 \times 81) \hat{i} + (0 + 0) \hat{j} + (0 + 4 \times 4 \times 27) \hat{k}$

$$= 324 \hat{i} + 432 \hat{k} = 108(3 \hat{i} + 4 \hat{k}) \quad \dots(1)$$

Normal to $x^2 + y^2 + z^2 - 14 = \vec{\nabla}\phi$

$$\begin{aligned} &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 14) \\ &= (2x \hat{i} + 2y \hat{j} + 2z \hat{k}) \end{aligned}$$

Normal vector at $(3, 2, 1) = 6 \hat{i} + 4 \hat{j} + 2 \hat{k} \quad \dots(2)$

$$\text{Unit normal vector} = \frac{6 \hat{i} + 4 \hat{j} + 2 \hat{k}}{\sqrt{36+16+4}} = \frac{2(3 \hat{i} + 2 \hat{j} + \hat{k})}{2\sqrt{14}} = \frac{3 \hat{i} + 2 \hat{j} + \hat{k}}{\sqrt{14}} \quad [\text{From (1), (2)}]$$

Directional derivative along the normal = $108(3 \hat{i} + 4 \hat{k}) \cdot \frac{3 \hat{i} + 2 \hat{j} + \hat{k}}{\sqrt{14}}$.

$$= \frac{108 \times (9 + 4)}{\sqrt{14}} = \frac{1404}{\sqrt{14}} \quad \text{Ans.}$$

Example 30. Find the directional derivative of $\nabla(\nabla f)$ at the point $(1, -2, 1)$ in the direction of the normal to the surface $xy^2z = 3x + z^2$, where $f = 2x^3y^2z^4$. (U.P., I Semester, Dec 2008)

Solution. Here, we have

$$\begin{aligned} f &= 2x^3y^2z^4 \\ \nabla f &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (2x^3y^2z^4) = 6x^2y^2z^4\hat{i} + 4x^3yz^4\hat{j} + 8x^3y^2z^3\hat{k} \\ \nabla(\nabla f) &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (6x^2y^2z^4\hat{i} + 4x^3yz^4\hat{j} + 8x^3y^2z^3\hat{k}) \\ &= 12xy^2z^4 + 4x^3z^4 + 24x^3y^2z^2 \end{aligned}$$

Directional derivative of $\nabla(\nabla f)$

$$\begin{aligned} &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (12xy^2z^4 + 4x^3z^4 + 24x^3y^2z^2) \\ &= (12y^2z^4 + 12x^2z^4 + 72x^2y^2z^2)\hat{i} + (24xyz4 + 48x^3yz2)\hat{j} \\ &\quad + (48xy^2z^3 + 16x^3z^3 + 48x^3y^2z)\hat{k} \end{aligned}$$

$$\begin{aligned} \text{Directional derivative at } (1, -2, 1) &= (48 + 12 + 288)\hat{i} + (-48 - 96)\hat{j} + (192 + 16 + 192)\hat{k} \\ &= 348\hat{i} - 144\hat{j} + 400\hat{k} \end{aligned}$$

$$\begin{aligned} \text{Normal to } (xy^2z - 3x - z^2) &= \nabla(xy^2z - 3x - z^2) \\ &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (xy^2z - 3x - z^2) \\ &= (y^2z - 3)\hat{i} + (2xyz)\hat{j} + (xy^2 - 2z)\hat{k} \end{aligned}$$

$$\text{Normal at } (1, -2, 1) = \hat{i} - 4\hat{j} + 2\hat{k}$$

$$\text{Unit Normal Vector} = \frac{\hat{i} - 4\hat{j} + 2\hat{k}}{\sqrt{1+16+4}} = \frac{1}{\sqrt{21}}(\hat{i} - 4\hat{j} + 2\hat{k})$$

Directional derivative in the direction of normal

$$\begin{aligned} &= (348\hat{i} - 144\hat{j} + 400\hat{k}) \frac{1}{\sqrt{21}}(\hat{i} - 4\hat{j} + 2\hat{k}) \\ &= \frac{1}{\sqrt{21}}(348 + 576 + 800) = \frac{1724}{\sqrt{21}} \quad \text{Ans.} \end{aligned}$$

Example 31. If the directional derivative of $\phi = a x^2 y + b y^2 z + c z^2 x$ at the point $(1, 1, 1)$ has maximum magnitude 15 in the direction parallel to the line $\frac{x-1}{2} = \frac{y-3}{-2} = \frac{z}{1}$, find the values of a , b and c . (U.P. I semester, Winter 2001)

Solution. Given $\phi = a x^2 y + b y^2 z + c z^2 x$

$$\begin{aligned} \bar{\nabla}\phi &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (a x^2 y + b y^2 z + c z^2 x) \\ &= \hat{i}(2axy + cz^2) + \hat{j}(ax^2 + 2byz) + \hat{k}(by^2 + 2czx) \end{aligned}$$

$$\bar{\nabla}\phi \text{ at the point } (1, 1, 1) = \hat{i}(2a + c) + \hat{j}(a + 2b) + \hat{k}(b + 2c) \quad \dots(1)$$

We know that the maximum value of the directional derivative is in the direction of $\bar{\nabla}\phi$.

$$\text{i.e. } |\nabla\phi| = 15 \Rightarrow (2a + c)^2 + (a + 2b)^2 + (b + 2c)^2 = (15)^2$$

But, the directional derivative is given to be maximum parallel to the line

$$\frac{x-1}{2} = \frac{y-3}{-2} = \frac{z}{1} \text{ i.e., parallel to the vector } 2\hat{i} - 2\hat{j} + \hat{k}. \quad \dots(2)$$

On comparing the coefficients of (1) and (2)

$$\Rightarrow \frac{2a+c}{2} = \frac{2b+a}{-2} = \frac{2c+b}{1}$$

$$\Rightarrow 2a+c = -2b-a \Rightarrow 3a+2b+c=0 \quad \dots(3)$$

$$\text{and } 2b+a = -2(2c+b)$$

$$\Rightarrow 2b+a = -4c-2b \Rightarrow a+4b+4c=0 \quad \dots(4)$$

Rewriting (3) and (4), we have

$$\left. \begin{array}{l} 3a+2b+c=0 \\ a+4b+4c=0 \end{array} \right\} \Rightarrow \frac{a}{4} = \frac{b}{-11} = \frac{c}{10} = k \text{ (say)}$$

$$\Rightarrow a = 4k, \quad b = -11k \quad \text{and} \quad c = 10k.$$

Now, we have

$$(2a+c)^2 + (2b+a)^2 + (2c+b)^2 = (15)^2$$

$$\Rightarrow (8k+10k)^2 + (-22k+4k)^2 + (20k-11k)^2 = (15)^2$$

$$\Rightarrow k = \pm \frac{5}{9}$$

$$\Rightarrow a = \pm \frac{20}{9}, \quad b = \pm \frac{55}{9} \quad \text{and} \quad c = \pm \frac{50}{9} \quad \text{Ans.}$$

Example 32. If $\bar{r} = x\hat{i} + y\hat{j} + z\hat{k}$, show that :

$$(i) \text{grad } r = \frac{\vec{r}}{r} \quad (ii) \text{grad} \left(\frac{1}{r} \right) = -\frac{\vec{r}}{r^3}. \quad (\text{Nagpur University, Summer 2002})$$

Solution. (i) $\bar{r} = x\hat{i} + y\hat{j} + z\hat{k} \Rightarrow r = \sqrt{x^2 + y^2 + z^2} \Rightarrow r^2 = x^2 + y^2 + z^2$

$$\therefore 2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r}$$

$$\text{Similarly, } \frac{\partial r}{\partial y} = \frac{y}{r} \quad \text{and} \quad \frac{\partial r}{\partial z} = \frac{z}{r}$$

$$\text{grad } r = \nabla r = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) r = \hat{i} \frac{\partial r}{\partial x} + \hat{j} \frac{\partial r}{\partial y} + \hat{k} \frac{\partial r}{\partial z}$$

$$= \hat{i} \frac{x}{r} + \hat{j} \frac{y}{r} + \hat{k} \frac{z}{r} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{r} = \frac{\bar{r}}{r}$$

Proved.

$$(ii) \text{grad} \left(\frac{1}{r} \right) = \nabla \left(\frac{1}{r} \right) = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \left(\frac{1}{r} \right) = \hat{i} \frac{\partial}{\partial x} \left(\frac{1}{r} \right) + \hat{j} \frac{\partial}{\partial y} \left(\frac{1}{r} \right) + \hat{k} \frac{\partial}{\partial z} \left(\frac{1}{r} \right)$$

$$= \hat{i} \left(-\frac{1}{r^2} \frac{\partial r}{\partial x} \right) + \hat{j} \left(-\frac{1}{r^2} \frac{\partial r}{\partial y} \right) + \hat{k} \left(-\frac{1}{r^2} \frac{\partial r}{\partial z} \right)$$

$$= \hat{i} \left(-\frac{1}{r^2} \frac{x}{r} \right) + \hat{j} \left(-\frac{1}{r^2} \frac{y}{r} \right) + \hat{k} \left(-\frac{1}{r^2} \frac{z}{r} \right) = -\frac{x\hat{i} + y\hat{j} + z\hat{k}}{r^3} = -\frac{\bar{r}}{r^3} \quad \text{Proved.}$$

Example 33. Prove that $\nabla^2 f(r) = f''(r) + \frac{2}{r} f'(r)$. (K. University, Dec. 2008)

Solution.

$$\begin{aligned}
\nabla f(r) &= \left(i \frac{\partial}{\partial x} + j \frac{\partial}{\partial y} + k \frac{\partial}{\partial z} \right) f(r) \\
&\quad \left[r^2 = x^2 + y^2 + z^2 \Rightarrow 2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r}, \frac{\partial r}{\partial y} = \frac{y}{r} \text{ and } \frac{\partial r}{\partial z} = \frac{z}{r} \right] \\
&= i f'(r) \frac{\partial r}{\partial x} + j f'(r) \frac{\partial r}{\partial y} + k f'(r) \frac{\partial r}{\partial z} = f'(r) \left[i \frac{x}{r} + j \frac{y}{r} + k \frac{z}{r} \right] \\
&= f'(r) \frac{xi + yj + zk}{r} \\
\nabla^2 f(r) &= \nabla [\nabla f(r)] = \left(i \frac{\partial}{\partial x} + j \frac{\partial}{\partial y} + k \frac{\partial}{\partial z} \right) \left[f'(r) \frac{xi + yj + zk}{r} \right] \\
&= \frac{\partial}{\partial x} \left[f'(r) \frac{x}{r} \right] + \frac{\partial}{\partial y} \left[f'(r) \frac{y}{r} \right] + \frac{\partial}{\partial z} \left[f'(r) \frac{z}{r} \right] \\
&= \left(f''(r) \frac{\partial r}{\partial x} \right) \left(\frac{x}{r} \right) + f'(r) \frac{r^2 - x^2}{r^2} \frac{\partial r}{\partial x} + \left(f''(r) \frac{\partial r}{\partial y} \right) \left(\frac{y}{r} \right) + f'(r) \frac{r^2 - y^2}{r^2} \frac{\partial r}{\partial y} + \\
&\quad \left(f''(r) \frac{\partial r}{\partial z} \right) \left(\frac{z}{r} \right) + f'(r) \frac{r^2 - z^2}{r^2} \frac{\partial r}{\partial z} \\
&= \left(f''(r) \frac{x}{r} \right) \left(\frac{x}{r} \right) + f'(r) \frac{r^2 - x^2}{r^2} + \left(f''(r) \frac{y}{r} \right) \left(\frac{y}{r} \right) + f'(r) \frac{r^2 - y^2}{r^2} + \left(f''(r) \frac{z}{r} \right) \left(\frac{z}{r} \right) + f'(r) \frac{r^2 - z^2}{r^2} \\
&= \left(f''(r) \frac{x^2}{r^2} + f'(r) \frac{r^2 - x^2}{r^2} \right) + \left(f''(r) \frac{y^2}{r^2} + f'(r) \frac{r^2 - y^2}{r^2} \right) + \left(f''(r) \frac{z^2}{r^2} + f'(r) \frac{r^2 - z^2}{r^2} \right) \\
&= f''(r) \frac{x^2}{r^2} + f'(r) \frac{y^2 + z^2}{r^2} + f''(r) \frac{y^2}{r^2} + f'(r) \frac{x^2 + z^2}{r^2} + f''(r) \frac{z^2}{r^2} + f'(r) \frac{x^2 + y^2}{r^2} \\
&= f''(r) \left[\frac{x^2}{r^2} + \frac{y^2}{r^2} + \frac{z^2}{r^2} \right] + f'(r) \left[\frac{y^2 + z^2}{r^2} + \frac{z^2 + x^2}{r^2} + \frac{x^2 + y^2}{r^2} \right] \\
&= f''(r) \frac{x^2 + y^2 + z^2}{r^2} + f'(r) \frac{2(x^2 + y^2 + z^2)}{r^3} = f''(r) \frac{r^2}{r^2} + f'(r) \frac{2r^2}{r^3} \\
&= f''(r) + f'(r) \frac{2}{r}
\end{aligned}$$

Ans.

EXERCISE 5.7

1. Evaluate $\text{grad } \phi$ if $\phi = \log(x^2 + y^2 + z^2)$ Ans. $\frac{2(x\hat{i} + y\hat{j} + z\hat{k})}{x^2 + y^2 + z^2}$

2. Find a unit normal vector to the surface $x^2 + y^2 + z^2 = 5$ at the point $(0, 1, 2)$. Ans. $\frac{1}{\sqrt{5}}(\hat{j} + 2\hat{k})$

(AMIETE, June 2010)

3. Calculate the directional derivative of the function $\phi(x, y, z) = xy^2 + yz^3$ at the point $(1, -1, 1)$ in the direction of $(3, 1, -1)$ (A.M.I.E.T.E. Winter 2009, 2000) Ans. $\frac{5}{\sqrt{11}}$

4. Find the direction in which the directional derivative of $f(x, y) = (x^2 - y^2)/xy$ at $(1, 1)$ is zero.

(Nagpur Winter 2000) Ans. $\frac{\hat{i} + \hat{j}}{\sqrt{2}}$

5. Find the directional derivative of the scalar function of $(x, y, z) = xyz$ in the direction of the outer normal to the surface $z = xy$ at the point $(3, 1, 3)$. **Ans.** $\frac{27}{\sqrt{11}}$
6. The temperature of the points in space is given by $T(x, y, z) = x^2 + y^2 - z$. A mosquito located at $(1, 1, 2)$ desires to fly in such a direction that it will get warm as soon as possible. In what direction should it move? **Ans.** $\frac{1}{3}(2\hat{i} + 2\hat{j} - \hat{k})$
7. If $\phi(x, y, z) = 3xz^2y - y^3z^2$, find $\text{grad } \phi$ at the point $(1, -2, -1)$ **Ans.** $-(16\hat{i} + 9\hat{j} + 4\hat{k})$
8. Find a unit vector normal to the surface $x^2y + 2xz = 4$ at the point $(2, -2, 3)$. **Ans.** $\frac{1}{3}(-\hat{i} + 2\hat{j} + 2\hat{k})$
9. What is the greatest rate of increase of the function $u = xyz^2$ at the point $(1, 0, 3)$? **Ans.** 9
10. If θ is the acute angle between the surfaces $xyz^2 = 3x + z^2$ and $3x^2 - y^2 + 2z = 1$ at the point $(1, -2, 1)$ show that $\cos \theta = 3/7\sqrt{6}$.
11. Find the values of constants a, b, c so that the maximum value of the directional directive of $\phi = axy^2 + byz + cz^2x^3$ at $(1, 2, -1)$ has a maximum magnitude 64 in the direction parallel to the axis of z . **Ans.** $a = b, b = 24, c = -8$
12. Find the values of λ and μ so that surfaces $\lambda x^2 - \mu yz = (\lambda + 2)x$ and $4x^2y + z^3 = 4$ intersect orthogonally at the point $(1, -1, 2)$. **Ans.** $\lambda = \frac{9}{2}, \mu = 1$
13. The position vector of a particle at time t is $R = \cos(t-1)\hat{i} + \sinh(t-1)\hat{j} + at^2\hat{k}$. If at $t = 1$, the acceleration of the particle be perpendicular to its position vector, then a is equal to
 (a) 0 (b) 1 (c) $\frac{1}{2}$ (d) $\frac{1}{\sqrt{2}}$ (AMIETE, Dec. 2009) **Ans.** (d)

5.29 DIVERGENCE OF A VECTOR FUNCTION

The divergence of a vector point function \vec{F} is denoted by $\text{div } \vec{F}$ and is defined as below.

Let $\vec{F} = F_1\hat{i} + F_2\hat{j} + F_3\hat{k}$
 $\text{div } \vec{F} = \vec{\nabla} \cdot \vec{F} = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (\hat{i} F_1 + \hat{j} F_2 + \hat{k} F_3) = \frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z}$

It is evident that $\text{div } \vec{F}$ is scalar function.

5.30 PHYSICAL INTERPRETATION OF DIVERGENCE

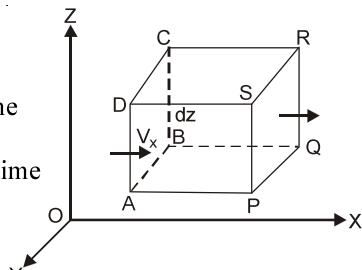

Let us consider the case of a fluid flow. Consider a small rectangular parallelopiped of dimensions dx, dy, dz parallel to x, y and z axes respectively.

Let $\vec{V} = V_x\hat{i} + V_y\hat{j} + V_z\hat{k}$ be the velocity of the fluid at $P(x, y, z)$.

\therefore Mass of fluid flowing in through the face $ABCD$ in unit time
 = Velocity \times Area of the face $= V_x(dy dz)$

Mass of fluid flowing out across the face $PQRS$ per unit time
 $= V_x(x + dx)(dy dz)$
 $= \left(V_x + \frac{\partial V_x}{\partial x} dx \right) (dy dz)$

Net decrease in mass of fluid in the parallelopiped corresponding to the flow along x -axis per unit time

$$\begin{aligned}
 &= V_x dy dz - \left(V_x + \frac{\partial V_x}{\partial x} dx \right) dy dz \\
 &= - \frac{\partial V_x}{\partial x} dx dy dz
 \end{aligned}
 \quad (\text{Minus sign shows decrease})$$

Similarly, the decrease in mass of fluid to the flow along y -axis = $\frac{\partial V_y}{\partial y} dx dy dz$

and the decrease in mass of fluid to the flow along z -axis = $\frac{\partial V_z}{\partial z} dx dy dz$

Total decrease of the amount of fluid per unit time = $\left(\frac{\partial V_x}{\partial x} + \frac{\partial V_y}{\partial y} + \frac{\partial V_z}{\partial z} \right) dx dy dz$

Thus the rate of loss of fluid per unit volume = $\frac{\partial V_x}{\partial x} + \frac{\partial V_y}{\partial y} + \frac{\partial V_z}{\partial z}$

$$= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (\hat{i} V_x + \hat{j} V_y + \hat{k} V_z) = \bar{\nabla} \cdot \bar{V} = \text{div } \bar{V}$$

If the fluid is compressible, there can be no gain or loss in the volume element. Hence

$$\text{div } \bar{V} = 0 \quad \dots(1)$$

and V is called a *Solenoidal* vector function.

Equation (1) is also called the *equation of continuity or conservation of mass*.

Example 34. If $\bar{v} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{\sqrt{x^2 + y^2 + z^2}}$, find the value of $\text{div } \bar{v}$.

(U.P., I Semester, Winter 2000)

Solution. We have, $\bar{v} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{\sqrt{x^2 + y^2 + z^2}}$

$$\begin{aligned}
 \text{div } \bar{v} &= \bar{\nabla} \cdot \bar{v} = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot \left(\frac{x \hat{i} + y \hat{j} + z \hat{k}}{(x^2 + y^2 + z^2)^{1/2}} \right) \\
 &= \frac{\partial}{\partial x} \frac{x}{(x^2 + y^2 + z^2)^{1/2}} + \frac{\partial}{\partial y} \frac{y}{(x^2 + y^2 + z^2)^{1/2}} + \frac{\partial}{\partial z} \frac{z}{(x^2 + y^2 + z^2)^{1/2}} \\
 &= \frac{\left[(x^2 + y^2 + z^2)^{1/2} - x \cdot \frac{1}{2} (x^2 + y^2 + z^2)^{-1/2} \cdot 2x \right]}{(x^2 + y^2 + z^2)} \\
 &+ \frac{\left[(x^2 + y^2 + z^2)^{1/2} - y \cdot \frac{1}{2} (x^2 + y^2 + z^2)^{-1/2} \cdot 2y \right]}{(x^2 + y^2 + z^2)} + \frac{\left[(x^2 + y^2 + z^2)^{1/2} - z \cdot \frac{1}{2} (x^2 + y^2 + z^2)^{-1/2} \cdot 2z \right]}{(x^2 + y^2 + z^2)} \\
 &= \frac{(x^2 + y^2 + z^2) - x^2}{(x^2 + y^2 + z^2)^{3/2}} + \frac{(x^2 + y^2 + z^2) - y^2}{(x^2 + y^2 + z^2)^{3/2}} + \frac{(x^2 + y^2 + z^2) - z^2}{(x^2 + y^2 + z^2)^{3/2}} \\
 &= \frac{y^2 + z^2 + x^2 + z^2 + x^2 + y^2}{(x^2 + y^2 + z^2)^{3/2}} = \frac{2(x^2 + y^2 + z^2)}{(x^2 + y^2 + z^2)^{3/2}} = \frac{2}{\sqrt{(x^2 + y^2 + z^2)}} \quad \text{Ans.}
 \end{aligned}$$

Example 35. If $u = x^2 + y^2 + z^2$, and $\bar{r} = x \hat{i} + y \hat{j} + z \hat{k}$, then find $\text{div } (u \bar{r})$ in terms of u .

(A.M.I.E.T.E., Summer 2004)

Solution. $\operatorname{div} (u \vec{r}) = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot [(x^2 + y^2 + z^2)(x \hat{i} + y \hat{j} + z \hat{k})]$

$$= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot [(x^2 + y^2 + z^2)x \hat{i} + (x^2 + y^2 + z^2)y \hat{j} + (x^2 + y^2 + z^2)z \hat{k}]$$

$$= \frac{\partial}{\partial x}(x^3 + xy^2 + xz^2) + \frac{\partial}{\partial y}(x^2y + y^3 + yz^2) + \frac{\partial}{\partial z}(x^2z + y^2z + z^3)$$

$$= (3x^2 + y^2 + z^2) + (x^2 + 3y^2 + z^2) + (x^2 + y^2 + 3z^2) = 5(x^2 + y^2 + z^2) = 5u \quad \text{Ans.}$$

Example 36. Find the value of n for which the vector $r^n \vec{r}$ is solenoidal, where $\vec{r} = x \hat{i} + y \hat{j} + z \hat{k}$.

Solution. Divergence $\vec{F} = \vec{\nabla} \cdot \vec{F} = \vec{\nabla} \cdot r^n \vec{r} = \nabla \cdot (x^2 + y^2 + z^2)^{n/2} (x \hat{i} + y \hat{j} + z \hat{k})$

$$= \left[\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right] \cdot [(x^2 + y^2 + z^2)^{n/2} x \hat{i} + (x^2 + y^2 + z^2)^{n/2} y \hat{j} + (x^2 + y^2 + z^2)^{n/2} z \hat{k}]$$

$$= \frac{n}{2} (x^2 + y^2 + z^2)^{n/2-1} (2x^2) + (x^2 + y^2 + z^2)^{n/2} + \frac{n}{2} (x^2 + y^2 + z^2)^{n/2-1} (2y^2)$$

$$+ (x^2 + y^2 + z^2)^{n/2} + \frac{n}{2} (x^2 + y^2 + z^2)^{n/2-1} (2z^2) + (x^2 + y^2 + z^2)^{n/2}$$

$$= n(x^2 + y^2 + z^2)^{n/2-1} (x^2 + y^2 + z^2) + 3(x^2 + y^2 + z^2)^{n/2}$$

$$= n(x^2 + y^2 + z^2)^{n/2} + 3(x^2 + y^2 + z^2)^{n/2} = (n+3)(x^2 + y^2 + z^2)^{n/2}$$

If $r^n \vec{r}$ is solenoidal, then $(n+3)(x^2 + y^2 + z^2)^{n/2} = 0$ or $n+3 = 0$ or $n = -3$. **Ans.**

Example 37. Show that $\nabla \left[\frac{(\vec{a} \cdot \vec{r})}{r^n} \right] = \frac{\vec{a}}{r^n} - \frac{n(\vec{a} \cdot \vec{r})}{r^{n+2}} \vec{r}$. **(M.U. 2005)**

Solution. We have, $\frac{\vec{a} \cdot \vec{r}}{r^n} = \frac{(a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) \cdot (x \hat{i} + y \hat{j} + z \hat{k})}{r^n} = \frac{a_1 x + a_2 y + a_3 z}{r^n}$

Let $\phi = \frac{\vec{a} \cdot \vec{r}}{r^n} = \frac{a_1 x + a_2 y + a_3 z}{r^n}$

$$\therefore \frac{\partial \phi}{\partial x} = \frac{r^n \cdot a_1 - (a_1 x + a_2 y + a_3 z) n r^{n-1} (\partial r / \partial x)}{r^{2n}}$$

But $r^2 = x^2 + y^2 + z^2 \Rightarrow 2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r}$

$$\therefore \frac{\partial \phi}{\partial x} = \frac{a_1 r^n - (a_1 x + a_2 y + a_3 z) n r^{n-2} x}{r^{2n}} = \frac{a_1}{r^n} - \frac{n(a_1 x + a_2 y + a_3 z) x}{r^{n+2}}$$

$$\therefore \nabla \phi = \frac{\partial \phi}{\partial x} \hat{i} + \frac{\partial \phi}{\partial y} \hat{j} + \frac{\partial \phi}{\partial z} \hat{k}$$

$$= \frac{1}{r^n} (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) - \frac{n}{r^{n+2}} [(a_1 x + a_2 y + a_3 z) (x \hat{i} + y \hat{j} + z \hat{k})]$$

$$= \frac{\vec{a}}{r^n} - \frac{n}{r^{n+2}} (\vec{a} \cdot \vec{r}) \vec{r}$$

Example 38. Let $\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$, $r = |\vec{r}|$ and \vec{a} is a constant vector. Find the value of

$$\operatorname{div} \left(\frac{\vec{a} \times \vec{r}}{r^n} \right)$$

Solution. Let $\vec{a} = a_1\hat{i} + a_2\hat{j} + a_3\hat{k}$

$$\vec{a} \times \vec{r} = (a_1\hat{i} + a_2\hat{j} + a_3\hat{k}) \times (x\hat{i} + y\hat{j} + z\hat{k})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ x & y & z \end{vmatrix} = (a_2z - a_3y)\hat{i} - (a_1z - a_3x)\hat{j} + (a_1y - a_2x)\hat{k}$$

$$\frac{\vec{a} \times \vec{r}}{|\vec{r}|^n} = \frac{(a_2z - a_3y)\hat{i} - (a_1z - a_3x)\hat{j} + (a_1y - a_2x)\hat{k}}{(x^2 + y^2 + z^2)^{n/2}}$$

$$\operatorname{div} \left(\frac{\vec{a} \times \vec{r}}{|\vec{r}|^n} \right) = \vec{\nabla} \cdot \frac{\vec{a} \times \vec{r}}{|\vec{r}|^n}$$

$$= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot \frac{(a_2z - a_3y)\hat{i} - (a_1z - a_3x)\hat{j} + (a_1y - a_2x)\hat{k}}{(x^2 + y^2 + z^2)^{n/2}}$$

$$= \frac{\partial}{\partial x} \frac{a_2z - a_3y}{(x^2 + y^2 + z^2)^{n/2}} - \frac{\partial}{\partial y} \frac{a_1z - a_3x}{(x^2 + y^2 + z^2)^{n/2}} + \frac{\partial}{\partial z} \frac{(a_1y - a_2x)}{(x^2 + y^2 + z^2)^{n/2}}$$

$$= -\frac{n}{2} \frac{(a_2z - a_3y)2x}{(x^2 + y^2 + z^2)^{\frac{n+2}{2}}} + \frac{n}{2} \frac{(a_1z - a_3x)2y}{(x^2 + y^2 + z^2)^{\frac{n+2}{2}}} - \frac{n}{2} \frac{(a_1y - a_2x)2z}{(x^2 + y^2 + z^2)^{\frac{n+2}{2}}}$$

$$= -\frac{n}{(x^2 + y^2 + z^2)^{\frac{n+2}{2}}} [(a_2z - a_3y)x - (a_1z - a_3x)y + (a_1y - a_2x)z]$$

$$= -\frac{n}{(x^2 + y^2 + z^2)^{\frac{n+2}{2}}} [a_2zx - a_3xy - a_1yz + a_3xy + a_1yz - a_2zx] = 0$$

Ans.

Example 39. Find the directional derivative of $\operatorname{div}(\vec{u})$ at the point $(1, 2, 2)$ in the direction of the outer normal of the sphere $x^2 + y^2 + z^2 = 9$ for $\vec{u} = x^4\hat{i} + y^4\hat{j} + z^4\hat{k}$.

Solution. $\operatorname{div}(\vec{u}) = \vec{\nabla} \cdot \vec{u}$

$$= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x^4\hat{i} + y^4\hat{j} + z^4\hat{k}) = 4x^3 + 4y^3 + 4z^3$$

Outer normal of the sphere = $\vec{\nabla}(x^2 + y^2 + z^2 - 9)$

$$= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 9) = 2x\hat{i} + 2y\hat{j} + 2z\hat{k}$$

Outer normal of the sphere at $(1, 2, 2) = 2\hat{i} + 4\hat{j} + 4\hat{k}$

... (1)

Directional derivative = $\vec{\nabla} \cdot (4x^3 + 4y^3 + 4z^3)$

$$= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (4x^3 + 4y^3 + 4z^3) = 12x^2\hat{i} + 12y^2\hat{j} + 12z^2\hat{k}$$

Directional derivative at $(1, 2, 2) = 12\hat{i} + 48\hat{j} + 48\hat{k}$

... (2)

$$\begin{aligned}
 \text{Directional derivative along the outer normal} &= (12\hat{i} + 48\hat{j} + 48\hat{k}) \cdot \frac{2\hat{i} + 4\hat{j} + 4\hat{k}}{\sqrt{4+16+16}} \\
 &= \frac{24 + 192 + 192}{6} = 68 \quad [\text{From (1), (2)}]
 \end{aligned}$$

Ans.

Example 40. Show that $\operatorname{div}(\operatorname{grad} r^n) = n(n+1)r^{n-2}$, where

$$r = \sqrt{x^2 + y^2 + z^2}$$

$$\text{Hence, show that } \Delta^2 \left(\frac{1}{r} \right) = 0. \quad (\text{U.P. I Semester, Dec. 2004, Winter 2002})$$

$$\begin{aligned}
 \text{Solution.} \quad \operatorname{grad}(r^n) &= \hat{i} \frac{\partial}{\partial x} r^n + \hat{j} \frac{\partial}{\partial y} r^n + \hat{k} \frac{\partial}{\partial z} r^n \quad \text{by definition} \\
 &= \hat{i} n r^{n-1} \frac{\partial r}{\partial x} + \hat{j} n r^{n-1} \frac{\partial r}{\partial y} + \hat{k} n r^{n-1} \frac{\partial r}{\partial z} = n r^{n-1} \left[\hat{i} \frac{\partial r}{\partial x} + \hat{j} \frac{\partial r}{\partial y} + \hat{k} \frac{\partial r}{\partial z} \right] \\
 &= n r^{n-1} \left[\hat{i} \left(\frac{x}{r} \right) + \hat{j} \left(\frac{y}{r} \right) + \hat{k} \left(\frac{z}{r} \right) \right] = n r^{n-2} (x \hat{i} + y \hat{j} + z \hat{k}) = n r^{n-2} \vec{r}. \\
 &\quad \left[\because r^2 = x^2 + y^2 + z^2 \Rightarrow 2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r} \text{ etc.} \right]
 \end{aligned}$$

$$\text{Thus, } \operatorname{grad}(r^n) = n r^{n-2} x \hat{i} + n r^{n-2} y \hat{j} + n r^{n-2} z \hat{k} \quad \dots(1)$$

$$\begin{aligned}
 \therefore \operatorname{div} \operatorname{grad} r^n &= \operatorname{div} [n r^{n-2} x \hat{i} + n r^{n-2} y \hat{j} + n r^{n-2} z \hat{k}] \\
 &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (n r^{n-2} x \hat{i} + n r^{n-2} y \hat{j} + n r^{n-2} z \hat{k}) \quad [\text{From (1)}] \\
 &= \frac{\partial}{\partial x} (n r^{n-2} x) + \frac{\partial}{\partial y} (n r^{n-2} y) + \frac{\partial}{\partial z} (n r^{n-2} z) \quad (\text{By definition}) \\
 &= \left(n r^{n-2} + n x (n-2) r^{n-3} \frac{\partial r}{\partial x} \right) + \left(n r^{n-2} + n y (n-2) r^{n-3} \frac{\partial r}{\partial y} \right) \\
 &\quad + \left(n r^{n-2} + n z (n-2) r^{n-3} \frac{\partial r}{\partial z} \right) \\
 &= 3n r^{n-2} + n(n-2) r^{n-3} \left[x \frac{\partial r}{\partial x} + y \frac{\partial r}{\partial y} + z \frac{\partial r}{\partial z} \right] \\
 &= 3n r^{n-2} + n(n-2) r^{n-3} \left[x \left(\frac{x}{r} \right) + y \left(\frac{y}{r} \right) + z \left(\frac{z}{r} \right) \right] \\
 &\quad \left[\because r^2 = x^2 + y^2 + z^2 \Rightarrow 2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r} \text{ etc.} \right] \\
 &= 3n r^{n-2} + n(n-2) r^{n-4} [x^2 + y^2 + z^2] \\
 &= 3n r^{n-2} + n(n-2) r^{n-4} r^2 \quad (\because r^2 = x^2 + y^2 + z^2) \\
 &= r^{n-2} [3n + n^2 - 2n] = r^{n-2} (n^2 + n) = n(n+1) r^{n-2}
 \end{aligned}$$

If we put $n = -1$

$$\begin{aligned}
 \operatorname{div} \operatorname{grad}(r^{-1}) &= -1 (-1 + 1) r^{-1-2} \\
 \Rightarrow \nabla^2 \left(\frac{1}{r} \right) &= 0
 \end{aligned}$$

Ques. If $\vec{r} = x \hat{i} + y \hat{j} + z \hat{k}$, and $r = |\vec{r}|$ find $\operatorname{div} \left(\frac{\vec{r}}{r^2} \right)$. (U.P. I Sem., Dec. 2006) **Ans.** $\frac{1}{r^2}$

EXERCISE 5.8

- If $r = x\hat{i} + y\hat{j} + z\hat{k}$ and $r = |\vec{r}|$, show that (i) $\operatorname{div} \left(\frac{\vec{r}}{|\vec{r}|^3} \right) = 0$,
(ii) $\operatorname{div}(\operatorname{grad} r^n) = n(n+1)r^{n-2}$ (AMIETE, June 2010) (iii) $\operatorname{div}(r\phi) = 3\phi + r\operatorname{grad}\phi$.
- Show that the vector $V = (x+3y)\hat{i} + (y-3z)\hat{j} + (x-2z)\hat{k}$ is solenoidal.
(R.G.P.V, Bhopal, Dec. 2003)
- Show that $\nabla \cdot (\phi A) = \nabla\phi \cdot A + \phi(\nabla \cdot A)$
- If ρ, ϕ, z are cylindrical coordinates, show that $\operatorname{grad}(\log \rho)$ and $\operatorname{grad}\phi$ are solenoidal vectors.
- Obtain the expression for $\nabla^2 f$ in spherical coordinates from their corresponding expression in orthogonal curvilinear coordinates.

Prove the following:

- $\vec{\nabla} \cdot (\phi \vec{F}) = (\vec{\nabla} \phi) \cdot \vec{F} + \phi(\vec{\nabla} \cdot \vec{F})$
- (a) $\nabla \cdot (\nabla \phi) = \nabla^2 \phi$ (b) $\vec{\nabla} \times \frac{(\vec{A} \times \vec{R})}{r^n} = \frac{(2-n)\vec{A}}{r^n} + \frac{n(\vec{A} \cdot \vec{R})\vec{R}}{r^{n+2}}, r = |\vec{R}|$
- $\operatorname{div}(f \nabla g) - \operatorname{div}(g \nabla f) = f \nabla^2 g - g \nabla^2 f$

5.31 CURL

(U.P., I semester, Dec. 2006)

The curl of a vector point function F is defined as below

$$\begin{aligned} \operatorname{curl} \vec{F} &= \vec{\nabla} \times \vec{F} & (\vec{F} = F_1\hat{i} + F_2\hat{j} + F_3\hat{k}) \\ &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (F_1\hat{i} + F_2\hat{j} + F_3\hat{k}) \\ &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ F_1 & F_2 & F_3 \end{vmatrix} = \hat{i} \left(\frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z} \right) - \hat{j} \left(\frac{\partial F_3}{\partial x} - \frac{\partial F_1}{\partial z} \right) + \hat{k} \left(\frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) \end{aligned}$$

Curl \vec{F} is a vector quantity.

5.32 PHYSICAL MEANING OF CURL

(M.D.U., Dec. 2009, U.P. I Semester, Winter 2009, 2000)

We know that $\vec{V} = \vec{\omega} \times \vec{r}$, where ω is the angular velocity, \vec{V} is the linear velocity and \vec{r} is the position vector of a point on the rotating body.

$$\begin{aligned} \operatorname{Curl} \vec{V} &= \vec{\nabla} \times \vec{V} & \left[\begin{array}{l} \vec{\omega} = \omega_1\hat{i} + \omega_2\hat{j} + \omega_3\hat{k} \\ \vec{r} = x\hat{i} + y\hat{j} + z\hat{k} \end{array} \right] \\ &= \vec{\nabla} \times (\vec{\omega} \times \vec{r}) = \vec{\nabla} \times [(\omega_1\hat{i} + \omega_2\hat{j} + \omega_3\hat{k}) \times (x\hat{i} + y\hat{j} + z\hat{k})] \\ &= \vec{\nabla} \times \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \omega_1 & \omega_2 & \omega_3 \\ x & y & z \end{vmatrix} = \vec{\nabla} \times [(\omega_2z - \omega_3y)\hat{i} - (\omega_1z - \omega_3x)\hat{j} + (\omega_1y - \omega_2x)\hat{k}] \\ &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [(\omega_2z - \omega_3y)\hat{i} - (\omega_1z - \omega_3x)\hat{j} + (\omega_1y - \omega_2x)\hat{k}] \end{aligned}$$

$$\begin{aligned}
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \omega_2 z - \omega_3 y & \omega_3 x - \omega_1 z & \omega_1 y - \omega_2 x \end{vmatrix} \\
&= (\omega_1 + \omega_2) \hat{i} - (-\omega_2 - \omega_3) \hat{j} + (\omega_3 + \omega_1) \hat{k} = 2(\omega_1 \hat{i} + \omega_2 \hat{j} + \omega_3 \hat{k}) = 2\omega
\end{aligned}$$

Curl $\vec{V} = 2\omega$ which shows that curl of a vector field is connected with rotational properties of the vector field and justifies the name *rotation* used for curl.

If $\text{Curl } \vec{F} = 0$, the field F is termed as *irrotational*.

Example 41. Find the divergence and curl of $\vec{v} = (xyz) \hat{i} + (3x^2y) \hat{j} + (xz^2 - y^2z) \hat{k}$ at $(2, -1, 1)$ (Nagpur University, Summer 2003)

Solution. Here, we have

$$\begin{aligned}
\vec{v} &= (xyz) \hat{i} + (3x^2y) \hat{j} + (xz^2 - y^2z) \hat{k} \\
\text{Div. } \vec{v} &= \nabla \phi \\
\text{Div } \vec{v} &= \frac{\partial}{\partial x}(xyz) + \frac{\partial}{\partial y}(3x^2y) + \frac{\partial}{\partial z}(xz^2 - y^2z) \\
&= yz + 3x^2 + 2xz - y^2 = -1 + 12 + 4 - 1 = 14 \text{ at } (2, -1, 1) \\
\text{Curl } \vec{v} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ xyz & 3x^2y & xz^2 - y^2z \end{vmatrix} = -2yz \hat{i} - (z^2 - xy) \hat{j} + (6xy - xz) \hat{k} \\
&= -2yz \hat{i} + (xy - z^2) \hat{j} + (6xy - xz) \hat{k} \\
\text{Curl at } (2, -1, 1) &= -2(-1)(1) \hat{i} + \{(2)(-1) - 1\} \hat{j} + \{6(2)(-1) - 2(1)\} \hat{k} \\
&= 2 \hat{i} - 3 \hat{j} - 14 \hat{k} \quad \text{Ans.}
\end{aligned}$$

Example 42. If $\vec{V} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{\sqrt{x^2 + y^2 + z^2}}$, find the value of curl \vec{V} .

(U.P., I Semester, Winter 2000)

Solution.

$$\begin{aligned}
\text{Curl } \vec{V} &= \vec{\nabla} \times \vec{V} \\
&= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times \left(\frac{x \hat{i} + y \hat{j} + z \hat{k}}{(x^2 + y^2 + z^2)^{1/2}} \right) \\
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{x}{(x^2 + y^2 + z^2)^{1/2}} & \frac{y}{(x^2 + y^2 + z^2)^{1/2}} & \frac{z}{(x^2 + y^2 + z^2)^{1/2}} \end{vmatrix}
\end{aligned}$$

$$\begin{aligned}
&= \hat{i} \left[\frac{\partial}{\partial y} \left(\frac{z}{(x^2 + y^2 + z^2)^{1/2}} \right) - \frac{\partial}{\partial z} \left(\frac{y}{(x^2 + y^2 + z^2)^{1/2}} \right) \right] - \hat{j} \left[\frac{\partial}{\partial x} \left(\frac{z}{(x^2 + y^2 + z^2)^{1/2}} \right) - \frac{\partial}{\partial y} \left(\frac{x}{(x^2 + y^2 + z^2)^{1/2}} \right) \right] \\
&\quad - \frac{\partial}{\partial z} \left(\frac{x}{(x^2 + y^2 + z^2)^{1/2}} \right) + \hat{k} \left[\frac{\partial}{\partial x} \left(\frac{y}{(x^2 + y^2 + z^2)^{1/2}} \right) - \frac{\partial}{\partial y} \left(\frac{x}{(x^2 + y^2 + z^2)^{1/2}} \right) \right] \\
&= \hat{i} \left[\frac{-yz}{(x^2 + y^2 + z^2)^{3/2}} + \frac{y \cdot z}{(x^2 + y^2 + z^2)^{3/2}} \right] - \hat{j} \left[\frac{-zx}{(x^2 + y^2 + z^2)^{3/2}} + \frac{zx}{(x^2 + y^2 + z^2)^{3/2}} \right] \\
&\quad + \hat{k} \left[\frac{-xy}{(x^2 + y^2 + z^2)^{3/2}} + \frac{xy}{(x^2 + y^2 + z^2)^{3/2}} \right] = 0 \quad \text{Ans.}
\end{aligned}$$

Example 43. Prove that $(y^2 - z^2 + 3yz - 2x)\hat{i} + (3xz + 2xy)\hat{j} + (3xy - 2xz + 2z)\hat{k}$ is both solenoidal and irrotational. (U.P., I Sem, Dec. 2008)

Solution. Let $\vec{F} = (y^2 - z^2 + 3yz - 2x)\hat{i} + (3xz + 2xy)\hat{j} + (3xy - 2xz + 2z)\hat{k}$

For solenoidal, we have to prove $\vec{\nabla} \cdot \vec{F} = 0$.

$$\begin{aligned}
\text{Now, } \vec{\nabla} \cdot \vec{F} &= \left[\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right] \cdot \left[(y^2 - z^2 + 3yz - 2x)\hat{i} + (3xz + 2xy)\hat{j} + (3xy - 2xz + 2z)\hat{k} \right] \\
&= -2 + 2x - 2x + 2 = 0
\end{aligned}$$

Thus, \vec{F} is solenoidal. For irrotational, we have to prove $\text{Curl } \vec{F} = 0$.

$$\begin{aligned}
\text{Now, } \text{Curl } \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 - z^2 + 3yz - 2x & 3xz + 2xy & 3xy - 2xz + 2z \end{vmatrix} \\
&= (3z + 2y - 2y + 3z)\hat{i} - (-2z + 3y - 3y + 2z)\hat{j} + \\
&\quad (3z + 2y - 2y - 3z)\hat{k} \\
&= 0\hat{i} + 0\hat{j} + 0\hat{k} = 0
\end{aligned}$$

Thus, \vec{F} is irrotational.

Hence, \vec{F} is both solenoidal and irrotational. Proved.

Example 44. Determine the constants a and b such that the curl of vector

$$\vec{A} = (2xy + 3yz)\hat{i} + (x^2 + axz - 4z^2)\hat{j} - (3xy + byz)\hat{k}$$

(U.P. I Semester, Dec 2008)

$$\text{Curl } A = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [(2xy + 3yz)\hat{i} + (x^2 + axz - 4z^2)\hat{j} - (3xy + byz)\hat{k}]$$

$$\begin{aligned}
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2xy + 3yz & x^2 + axz - 4z^2 & -3xy - byz \end{vmatrix} - (3xy + byz)\hat{k} \\
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2xy + 3yz & x^2 + axz - 4z^2 & -3xy - byz \end{vmatrix} - (3xy + byz)\hat{k}
\end{aligned}$$

$$\begin{aligned}
&= [-3x - bz - ax + 8z] \hat{i} - [-3y - 3y] \hat{j} + [2x + az - 2x - 3z] \hat{k} \\
&= [-x(3+a) + z(8-b)] \hat{i} + 6y \hat{j} + z(-3+a) \hat{k} \\
&= 0 \quad \text{(given)} \\
\text{i.e., } 3+a &= 0 \quad \text{and } 8-b = 0, \quad -3+a = 0 \\
a &= -3, \quad b = 8 \quad \Rightarrow \quad a = 3 \quad \text{Ans.}
\end{aligned}$$

Example 45. If a vector field is given by

$$\vec{F} = (x^2 - y^2 + x) \hat{i} - (2xy + y) \hat{j}. \text{ Is this field irrotational? If so, find its scalar potential.}$$

(U.P. I Semester, Dec 2009)

Solution. Here, we have

$$\vec{F} = (x^2 - y^2 + x) \hat{i} - (2xy + y) \hat{j}$$

$$\text{Curl } F = \nabla \times \vec{F}$$

$$\begin{aligned}
&= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (x^2 - y^2 + x) \hat{i} - (2xy + y) \hat{j} \\
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 - y^2 + x & -2xy - y & 0 \end{vmatrix} = \hat{i}(0-0) - \hat{j}(0-0) + \hat{k}(-2y+2y) = 0
\end{aligned}$$

Hence, vector field \vec{F} is irrotational.

To find the scalar potential function ϕ

$$\vec{F} = \nabla \phi$$

$$\begin{aligned}
d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz = \left| \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right| \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
&= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi \cdot (\vec{d} \cdot \vec{r}) = \nabla \phi \cdot \vec{d} \cdot \vec{r} = \vec{F} \cdot \vec{d} \cdot \vec{r} \\
&= [(x^2 - y^2 + x) \hat{i} - (2xy + y) \hat{j}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
&= (x^2 - y^2 + x) dx - (2xy + y) dy.
\end{aligned}$$

$$\begin{aligned}
\phi &= \int [(x^2 - y^2 + x) dx - (2xy + y) dy] + c \\
&= \int [x^3 + \frac{x^2}{2} - \frac{y^2}{2} - xy^2] + c = \frac{x^3}{3} + \frac{x^2}{2} - \frac{y^2}{2} - xy^2 + c
\end{aligned}$$

Hence, the scalar potential is $\frac{x^3}{3} + \frac{x^2}{2} - \frac{y^2}{2} - xy^2 + c$

Ans.

Example 46. Find the scalar potential function f for $\vec{A} = y^2 \hat{i} + 2xy \hat{j} - z^2 \hat{k}$.

(Gujarat, I Semester, Jan. 2009)

Solution. We have,

$$\vec{A} = y^2 \hat{i} + 2xy \hat{j} - z^2 \hat{k}$$

$$\text{Curl } \vec{A} = \nabla \times \vec{A} = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (y^2 \hat{i} + 2xy \hat{j} - z^2 \hat{k})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 & 2xy & -z^2 \end{vmatrix} = \hat{i}(0) - \hat{j}(0) + \hat{k}(2y - 2y) = 0$$

Hence, \vec{A} is irrotational. To find the scalar potential function f .

$$\begin{aligned} \vec{A} &= \nabla f \\ df &= \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy + \frac{\partial f}{\partial z} dz = \left(\hat{i} \frac{\partial f}{\partial x} + \hat{j} \frac{\partial f}{\partial y} + \hat{k} \frac{\partial f}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\ &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) f \cdot dr = \nabla f \cdot d\vec{r} \\ &= \vec{A} \cdot dr \quad (A = \nabla f) \\ &= (y^2 \hat{i} + 2xy \hat{j} - z^2 \hat{k}) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\ &= y^2 dx + 2xy dy - z^2 dz = d(xy^2) - z^2 dz \\ f &= \int d(xy^2) - \int z^2 dz = xy^2 - \frac{z^3}{3} + C \quad \text{Ans.} \end{aligned}$$

Example 47. A vector field is given by $\vec{A} = (x^2 + xy^2) \hat{i} + (y^2 + x^2y) \hat{j}$. Show that the field is irrotational and find the scalar potential. (Nagpur University, Summer 2003, Winter 2002)

Solution. \vec{A} is irrotational if $\text{curl } \vec{A} = 0$

$$\text{Curl } \vec{A} = \nabla \times \vec{A} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 + xy^2 & y^2 + x^2y & 0 \end{vmatrix} = \hat{i}(0 - 0) - \hat{j}(0 - 0) + \hat{k}(2xy - 2xy) = 0$$

Hence, \vec{A} is irrotational. If ϕ is the scalar potential, then

$$\vec{A} = \text{grad } \phi$$

$$\begin{aligned} d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz \quad [\text{Total differential coefficient}] \\ &= \left(\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \text{grad } \phi \cdot dr \\ &= \vec{A} \cdot dr = [(x^2 + xy^2) \hat{i} + (y^2 + x^2y) \hat{j}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\ &= (x^2 + xy^2) dx + (y^2 + x^2y) dy = x^2 dx + y^2 dy + (x dx)y^2 + (x^2)(y dy) \end{aligned}$$

$$\phi = \int x^2 dx + \int y^2 dy + \int [(x dx)y^2 + (x^2)(y dy)] = \frac{x^3}{3} + \frac{y^3}{3} + \frac{x^2 y^2}{2} + c \quad \text{Ans.}$$

Example 48. Show that $\vec{V}(x, y, z) = 2x y z \hat{i} + (x^2 z + 2y) \hat{j} + x^2 y \hat{k}$ is irrotational and find a scalar function $u(x, y, z)$ such that $\vec{V} = \text{grad } (u)$.

$$\text{Solution. } \vec{V}(x, y, z) = 2x y z \hat{i} + (x^2 z + 2y) \hat{j} + x^2 y \hat{k}$$

$$\begin{aligned}
 \text{Curl } \vec{V} &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [2xyz\hat{i} + (x^2z + 2y)\hat{j} + x^2y\hat{k}] \\
 &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2xyz & x^2z + 2y & x^2y \end{vmatrix} \\
 &= (x^2 - x^2)\hat{i} - (2xy - 2xy)\hat{j} + (2xz - 2xz)\hat{k} = 0
 \end{aligned}$$

Hence, $\vec{V}(x, y, z)$ is irrotational.

To find corresponding scalar function u , consider the following relations given

$$\begin{aligned}
 \vec{V} &= \text{grad } (u) \\
 \text{or} \quad \vec{V} &= \vec{\nabla}(u) \quad \dots(1) \\
 du &= \frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy + \frac{\partial u}{\partial z} dz \quad (\text{Total differential coefficient}) \\
 &= \left(\hat{i} \frac{\partial u}{\partial x} + \hat{j} \frac{\partial u}{\partial y} + \hat{k} \frac{\partial u}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= \vec{\nabla} u \cdot d\vec{r} = \vec{V} \cdot d\vec{r} \quad [\text{From (1)}] \\
 &= [2xyz\hat{i} + (x^2z + 2y)\hat{j} + x^2y\hat{k}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= 2xyz dx + (x^2z + 2y) dy + x^2y dz \\
 &= y(2xz dx + x^2 dz) + (x^2z) dy + 2y dy \\
 &= [y d(x^2z) + (x^2z) dy] + 2y dy = d(x^2yz) + 2y dy
 \end{aligned}$$

Integrating, we get $u = x^2yz + y^2$

Ans.

Example 49. A fluid motion is given by $\vec{v} = (y+z)\hat{i} + (z+x)\hat{j} + (x+y)\hat{k}$. Show that the motion is irrotational and hence find the velocity potential.

(Uttarakhand, I Semester 2006; U.P., I Semester; Winter 2003)

$$\begin{aligned}
 \text{Solution.} \quad \text{Curl } \vec{v} &= \nabla \times \vec{v} \\
 &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [(y+z)\hat{i} + (z+x)\hat{j} + (x+y)\hat{k}] \\
 &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y+z & z+x & x+y \end{vmatrix} = (1-1)\hat{i} - (1-1)\hat{j} + (1-1)\hat{k} = 0
 \end{aligned}$$

Hence, \vec{v} is irrotational.

To find the corresponding velocity potential ϕ , consider the following relation.

$$\begin{aligned}
 \vec{v} &= \nabla\phi \\
 d\phi &= \frac{\partial\phi}{\partial x} dx + \frac{\partial\phi}{\partial y} dy + \frac{\partial\phi}{\partial z} dz \quad [\text{Total Differential coefficient}]
 \end{aligned}$$

$$\begin{aligned}
&= \left(\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi \cdot d\vec{r} = \nabla \phi \cdot d\vec{r} = \vec{v} \cdot d\vec{r} \\
&= [(y+z)\hat{i} + (z+x)\hat{j} + (x+y)\hat{k}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
&= (y+z)dx + (z+x)dy + (x+y)dz \\
&= ydx + zdx + zdy + xdy + xdz + ydz \\
\phi &= \int (ydx + xdy) + \int (zdy + ydz) + \int (xdz + xdz) \\
\phi &= xy + yz + zx + c
\end{aligned}$$

Velocity potential = $xy + yz + zx + c$

Example 50. A fluid motion is given by

$$\vec{v} = (y \sin z - \sin x)\hat{i} + (x \sin z + 2yz)\hat{j} + (xy \cos z + y^2)\hat{k}$$

is the motion irrotational? If so, find the velocity potential.

Ans.

Solution. $\text{Curl } \vec{v} = \vec{\nabla} \times \vec{v}$

$$\begin{aligned}
&= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (y \sin z - \sin x)\hat{i} + (x \sin z + 2yz)\hat{j} + (xy \cos z + y^2)\hat{k} \\
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y \sin z - \sin x & x \sin z + 2yz & xy \cos z + y^2 \end{vmatrix} \\
&= (x \cos z + 2y - x \cos z - 2y)\hat{i} - [y \cos z - y \cos z]\hat{j} + (\sin z - \sin z)\hat{k} = 0
\end{aligned}$$

Hence, the motion is irrotational.

So, $\vec{v} = \vec{\nabla} \phi$ where ϕ is called velocity potential.

$$\begin{aligned}
d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz \quad [\text{Total differential coefficient}] \\
&= \left(\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \vec{\nabla} \phi \cdot d\vec{r} = \vec{v} \cdot d\vec{r} \\
&= [(y \sin z - \sin x)\hat{i} + (x \sin z + 2yz)\hat{j} + (xy \cos z + y^2)\hat{k}] \cdot [\hat{i} dx + \hat{j} dy + \hat{k} dz] \\
&= (y \sin z - \sin x)dx + (x \sin z + 2yz)dy + (xy \cos z + y^2)dz \\
&= (y \sin z dx + x dy \sin z + x y \cos z dz) - \sin x dx + (2yz dy + y^2 dz) \\
&= d(xy \sin z) + d(\cos x) + d(y^2 z)
\end{aligned}$$

$$\phi = \int d(xy \sin z) + \int d(\cos x) + \int d(y^2 z)$$

$$\phi = xy \sin z + \cos x + y^2 z + c$$

Hence, Velocity potential = $xy \sin z + \cos x + y^2 z + c$.

Ans.

Example 51. Prove that $\vec{F} = r^2 \vec{r}$ is conservative and find the scalar potential ϕ such that

$$\vec{F} = \vec{\nabla} \phi. \quad (\text{Nagpur University, Summer 2004})$$

Solution. Given $\vec{F} = r^2 \vec{r} = r^2(x\hat{i} + y\hat{j} + z\hat{k}) = r^2 x\hat{i} + r^2 y\hat{j} + r^2 z\hat{k}$

$$\text{Consider } \vec{\nabla} \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ r^2 x & r^2 y & r^2 z \end{vmatrix}$$

$$\begin{aligned}
&= \hat{i} \left[\frac{\partial}{\partial y} r^2 z - \frac{\partial}{\partial z} r^2 y \right] - \hat{j} \left[\frac{\partial}{\partial x} r^2 z - \frac{\partial}{\partial z} r^2 x \right] + \hat{k} \left[\frac{\partial}{\partial x} r^2 y - \frac{\partial}{\partial y} r^2 x \right] \\
&= \hat{i} \left[2rz \frac{\partial r}{\partial y} - 2ry \frac{\partial r}{\partial z} \right] - \hat{j} \left[2rz \frac{\partial r}{\partial x} - 2rx \frac{\partial r}{\partial z} \right] + \hat{k} \left[2ry \frac{\partial r}{\partial x} - 2rx \frac{\partial r}{\partial y} \right] \\
&\quad \left[\text{But } r^2 = x^2 + y^2 + z^2, \frac{\partial r}{\partial x} = \frac{x}{r}, \frac{\partial r}{\partial y} = \frac{y}{r}, \frac{\partial r}{\partial z} = \frac{z}{r} \right] \\
&= \hat{i} \left[2rz \frac{y}{r} - 2ry \frac{z}{r} \right] - \hat{j} \left[2rz \frac{x}{r} - 2rx \frac{z}{r} \right] + \hat{k} \left[2ry \frac{x}{r} - 2rx \frac{y}{r} \right] \\
&= \hat{i}(2yz - 2yz) - \hat{j}(2zx - 2zx) + \hat{k}(2xy - 2xy) = 0\hat{i} - 0\hat{j} + 0\hat{k} = 0
\end{aligned}$$

$$\therefore \nabla \times \vec{F} = 0$$

$$\therefore \vec{F} \text{ is irrotational} \quad \therefore F \text{ is conservative.}$$

Consider scalar potential ϕ such that $\vec{F} = \nabla\phi$.

$$\begin{aligned}
d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz && \text{[Total differential coefficient]} \\
&= \left(\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
&= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \nabla\phi \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
&= \vec{F} \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = r^2 \vec{r} \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) && (\nabla\phi = \vec{F}) \\
&= (x^2 + y^2 + z^2) (\hat{i} x + \hat{j} y + \hat{k} z) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
&= (x^2 + y^2 + z^2) (x dx + y dy + z dz) \\
&= x^3 dx + y^3 dy + z^3 dz + (x dx) y^2 + (x^2) (y dy) \\
&\quad + (x dx) z^2 + z^2 (y dy) + x^2 (z dz) + y^2 (z dz) \\
\phi &= \int x^3 dx + \int y^3 dy + \int z^3 dz + \int [(x dx) y^2 + (y dy) x^2] \\
&\quad + \int [(x dx) z^2 + (z dz) x^2] + \int [(y dy) z^2 + (z dz) y^2] \\
&= \frac{x^4}{4} + \frac{y^4}{4} + \frac{z^4}{4} + \frac{1}{2} x^2 y^2 + \frac{1}{2} x^2 z^2 + \frac{1}{2} y^2 z^2 + c \\
&= \frac{1}{4} (x^4 + y^4 + z^4 + 2x^2 y^2 + 2x^2 z^2 + 2y^2 z^2) + c && \text{Ans.}
\end{aligned}$$

Example 52. Show that the vector field $\vec{F} = \frac{\vec{r}}{|\vec{r}|^3}$ is irrotational as well as solenoidal. Find the scalar potential.

(Nagpur University, Summer 2008, 2001, U.P. I Semester Dec. 2005, 2001)

$$\text{Solution.} \quad F = \frac{\vec{r}}{|\vec{r}|^3} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{(x^2 + y^2 + z^2)^{3/2}}$$

$$\text{Curl } \vec{F} = \vec{\nabla} \times \vec{F} = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times \left(\frac{x\hat{i} + y\hat{j} + z\hat{k}}{(x^2 + y^2 + z^2)^{3/2}} \right)$$

$$\begin{aligned}
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{x}{(x^2 + y^2 + z^2)^{3/2}} & \frac{y}{(x^2 + y^2 + z^2)^{3/2}} & \frac{z}{(x^2 + y^2 + z^2)^{3/2}} \end{vmatrix} \\
&= \hat{i} \left[\frac{-3}{2} \frac{2yz}{(x^2 + y^2 + z^2)^{5/2}} + \frac{3}{2} \frac{2yz}{(x^2 + y^2 + z^2)^{5/2}} \right] \\
&\quad - \hat{j} \left[\frac{-3}{2} \frac{2xz}{(x^2 + y^2 + z^2)^{5/2}} - \left(-\frac{3}{2} \right) \frac{2xz}{(x^2 + y^2 + z^2)^{5/2}} \right] \\
&\quad + \hat{k} \left[-\frac{3}{2} \frac{2xy}{(x^2 + y^2 + z^2)^{5/2}} - \left(-\frac{3}{2} \right) \frac{2xy}{(x^2 + y^2 + z^2)^{5/2}} \right] \\
&= 0
\end{aligned}$$

Hence, \vec{F} is irrotational.

$$\begin{aligned}
\Rightarrow \vec{F} &= \vec{\nabla} \phi, \text{ where } \phi \text{ is called scalar potential} \\
d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz \quad [\text{Total differential coefficient}] \\
&= \left(\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \vec{\nabla} \phi \cdot d\vec{r} = \vec{F} \cdot d\vec{r} \\
&= \frac{x \hat{i} + y \hat{j} + z \hat{k}}{(x^2 + y^2 + z^2)^{3/2}} \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \frac{x dx + y dy + z dz}{(x^2 + y^2 + z^2)^{3/2}} \\
\phi &= \frac{1}{2} \int \frac{2x dx + 2y dy + 2z dz}{(x^2 + y^2 + z^2)^{3/2}} \\
&= \frac{1}{2} \left(-\frac{2}{1} \right) (x^2 + y^2 + z^2)^{-\frac{1}{2}} = -\frac{1}{(x^2 + y^2 + z^2)^{\frac{1}{2}}} = -\frac{1}{|\vec{r}|} \quad \text{Ans.}
\end{aligned}$$

Now, $\text{Div } \vec{F} = \vec{\nabla} \cdot \vec{F}$

$$\begin{aligned}
&= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot \frac{x \hat{i} + y \hat{j} + z \hat{k}}{(x^2 + y^2 + z^2)^{3/2}} \\
&= \frac{\partial}{\partial x} \frac{x}{(x^2 + y^2 + z^2)^{3/2}} + \frac{\partial}{\partial y} \frac{y}{(x^2 + y^2 + z^2)^{3/2}} + \frac{\partial}{\partial z} \frac{z}{(x^2 + y^2 + z^2)^{3/2}} \\
&= \frac{(x^2 + y^2 + z^2)^{3/2} (1) - x \left(\frac{3}{2} \right) (x^2 + y^2 + z^2)^{1/2} (2x)}{(x^2 + y^2 + z^2)^3} \\
&\quad + \frac{(x^2 + y^2 + z^2)^{3/2} (1) - y \left(\frac{3}{2} \right) (x^2 + y^2 + z^2)^{1/2} (2y)}{(x^2 + y^2 + z^2)^3} \\
&\quad + \frac{(x^2 + y^2 + z^2)^{3/2} (1) - z \left(\frac{3}{2} \right) (x^2 + y^2 + z^2)^{1/2} (2z)}{(x^2 + y^2 + z^2)^3}
\end{aligned}$$

$$\begin{aligned}
&= \frac{(x^2 + y^2 + z^2)^{1/2}}{(x^2 + y^2 + z^2)^3} [x^2 + y^2 + z^2 - 3x^2 + x^2 + y^2 + z^2 - 3y^2 + x^2 + y^2 + z^2 - 3z^2] \\
&= 0
\end{aligned}$$

Hence, \vec{F} is solenoidal.

Proved.

Example 53. Given the vector field $\vec{V} = (x^2 - y^2 + 2xz) \hat{i} + (xz - xy + yz) \hat{j} + (z^2 + x^2) \hat{k}$ find $\operatorname{curl} \vec{V}$. Show that the vectors given by $\operatorname{curl} \vec{V}$ at $P_0(1, 2, -3)$ and $P_1(2, 3, 12)$ are orthogonal.

Solution. $\operatorname{curl} \vec{V} = \vec{\nabla} \times \vec{V}$

$$\begin{aligned}
&= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [(x^2 - y^2 + 2xz) \hat{i} + (xz - xy + yz) \hat{j} + (z^2 + x^2) \hat{k}]
\end{aligned}$$

$$\begin{aligned}
\operatorname{curl} \vec{V} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 - y^2 + 2xz & xz - xy + yz & z^2 + x^2 \end{vmatrix} \\
&= -(x + y) \hat{i} - (2x - 2y) \hat{j} + (z - y + 2y) \hat{k} = -(x + y) \hat{i} + (y + z) \hat{k}
\end{aligned}$$

$$\operatorname{curl} \vec{V} \text{ at } P_0(1, 2, -3) = -(1+2) \hat{i} + (2-3) \hat{k} = -3 \hat{i} - \hat{k}$$

$$\operatorname{curl} \vec{V} \text{ at } P_1(2, 3, 12) = -(2+3) \hat{i} + (3+12) \hat{k} = -5 \hat{i} + 15 \hat{k}$$

The $\operatorname{curl} \vec{V}$ at $(1, 2, -3)$ and $(2, 3, 12)$ are perpendicular since

$$(-3 \hat{i} - \hat{k}) \cdot (-5 \hat{i} + 15 \hat{k}) = +15 - 15 = 0$$

Proved.

Example 54. Find the constants a, b, c , so that

$$\vec{F} = (x + 2y + az) \hat{i} + (bx - 3y - z) \hat{j} + (4x + cy + 2z) \hat{k} \quad \dots(1)$$

is irrotational and hence find function ϕ such that $\vec{F} = \nabla \phi$.

(Nagpur University, Summer 2005, Winter 2000; R.G.P.V., Bhopal 2009)

Solution. We have,

$$\begin{aligned}
\therefore \nabla \times \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ (x + 2y + az) & (bx - 3y - z) & (4x + cy + 2z) \end{vmatrix} \\
&= (c + 1) \hat{i} - (4 - a) \hat{j} + (b - 2) \hat{k}
\end{aligned}$$

As \vec{F} is irrotational, $\nabla \times \vec{F} = \vec{0}$

$$\text{i.e., } (c + 1) \hat{i} - (4 - a) \hat{j} + (b - 2) \hat{k} = 0 \hat{i} + 0 \hat{j} + 0 \hat{k}$$

$$\therefore c + 1 = 0, \quad 4 - a = 0 \quad \text{and} \quad b - 2 = 0$$

$$\text{i.e., } a = 4, \quad b = 2, \quad c = -1$$

Putting the values of a, b, c in (1), we get

$$\vec{F} = (x + 2y + 4z) \hat{i} + (2x - 3y - z) \hat{j} + (4x + y + 2z) \hat{k}$$

Now we have to find ϕ such that $\vec{F} = \nabla\phi$

We know that

$$\begin{aligned}
 d\phi &= \frac{\partial\phi}{\partial x} dx + \frac{\partial\phi}{\partial y} dy + \frac{\partial\phi}{\partial z} dz && \text{[Total differential coefficient]} \\
 &= \left(\hat{i} \frac{\partial\phi}{\partial x} + \hat{j} \frac{\partial\phi}{\partial y} + \hat{k} \frac{\partial\phi}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \nabla\phi \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= \vec{F} \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= [(x+2y+4z) \hat{i} + (2x-3y-z) \hat{j} + (4x-y+2z) \hat{k}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
 &= (x+2y+4z) dx + (2x-3y-z) dy + (4x-y+2z) dz \\
 &= x dx - 3y dy + 2z dz + (2y dx + 2x dy) + (4z dx + 4x dz) + (-z dy - y dz) \\
 \phi &= \int x dx - 3 \int y dy + 2 \int z dz + \int (2y dx + 2x dy) + \int (4z dx + 4x dz) - \int (z dy - y dz) \\
 &= \frac{x^2}{2} - \frac{3y^2}{2} + z^2 + 2xy + 4zx - yz + c
 \end{aligned}$$

Ans.

Example 55. Let $\vec{V}(x, y, z)$ be a differentiable vector function and $\phi(x, y, z)$ be a scalar function. Derive an expression for $\text{div}(\phi \vec{V})$ in terms of ϕ , \vec{V} , $\text{div} \vec{V}$ and $\nabla\phi$.
(U.P. I Semester, Winter 2003)

Solution. Let $\vec{V} = V_1 \hat{i} + V_2 \hat{j} + V_3 \hat{k}$

$$\begin{aligned}
 \text{div}(\phi \vec{V}) &= \vec{\nabla} \cdot (\phi \vec{V}) \\
 &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot [\phi V_1 \hat{i} + \phi V_2 \hat{j} + \phi V_3 \hat{k}] = \frac{\partial}{\partial x}(\phi V_1) + \frac{\partial}{\partial y}(\phi V_2) + \frac{\partial}{\partial z}(\phi V_3) \\
 &= \left(\phi \frac{\partial V_1}{\partial x} + \frac{\partial \phi}{\partial x} V_1 \right) + \left(\phi \frac{\partial V_2}{\partial y} + \frac{\partial \phi}{\partial y} V_2 \right) + \left(\phi \frac{\partial V_3}{\partial z} + \frac{\partial \phi}{\partial z} V_3 \right) \\
 &= \phi \left(\frac{\partial V_1}{\partial x} + \frac{\partial V_2}{\partial y} + \frac{\partial V_3}{\partial z} \right) + \left(\frac{\partial \phi}{\partial x} V_1 + \frac{\partial \phi}{\partial y} V_2 + \frac{\partial \phi}{\partial z} V_3 \right) \\
 &= \phi \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (V_1 \hat{i} + V_2 \hat{j} + V_3 \hat{k}) + \left(\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (V_1 \hat{i} + V_2 \hat{j} + V_3 \hat{k}) \\
 &= \phi (\vec{\nabla} \cdot \vec{V}) + (\vec{\nabla} \phi) \cdot \vec{V} = \phi (\text{div} \vec{V}) + (\text{grad} \phi) \cdot \vec{V}
 \end{aligned}$$

Ans.

Example 56. If \vec{A} is a constant vector and $\vec{R} = x \hat{i} + y \hat{j} + z \hat{k}$, then prove that

$$\text{Curl} \left[\left(\vec{A} \cdot \vec{R} \right) \vec{A} \right] = \vec{A} \times \vec{R} \quad (\text{K. University, Dec. 2009})$$

Solution. Let $\vec{A} = A_1 \hat{i} + A_2 \hat{j} + A_3 \hat{k}$, $\vec{R} = x \hat{i} + y \hat{j} + z \hat{k}$

$$\begin{aligned}
 \vec{A} \cdot \vec{R} &= (A_1 \hat{i} + A_2 \hat{j} + A_3 \hat{k}) \cdot (x \hat{i} + y \hat{j} + z \hat{k}) = A_1 x + A_2 y + A_3 z \\
 [\vec{A} \cdot \vec{R}] \vec{R} &= (A_1 x + A_2 y + A_3 z) (x \hat{i} + y \hat{j} + z \hat{k}) \\
 &= (A_1 x^2 + A_2 xy + A_3 zx) \hat{i} + (A_1 xy + A_2 y^2 + A_3 yz) \hat{j} + (A_1 xz + A_2 yz + A_3 z^2) \hat{k}
 \end{aligned}$$

$$\text{Curl} \left[(\vec{A} \cdot \vec{R}) \vec{R} \right] = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ A_1 x^2 + A_2 xy + A_3 zx & A_2 xy + A_2 y^2 + A_3 yz & A_1 xz + A_2 yz + A_3 z^2 \end{vmatrix} = (A_2 z - A_3 y) \hat{i} - [A_1 z - A_3 x] \hat{j} [A_1 y - A_2 x] \hat{k} \quad \dots (1)$$

$$\text{L.H.S.} = \vec{A} \times \vec{R}$$

$$= (A_1 \hat{i} + A_2 \hat{j} + A_3 \hat{k}) \times (x \hat{i} + y \hat{j} + z \hat{k})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ A_1 & A_2 & A_3 \\ x & y & z \end{vmatrix}$$

$$= (A_2 z - A_3 y) \hat{i} - (A_1 z - A_3 x) \hat{j} + (A_1 y - A_2 x) \hat{k}$$

$$= \text{R.H.S.}$$

[From (1)]

Example 57. Suppose that \vec{U}, \vec{V} and f are continuously differentiable fields then
Prove that, $\text{div} (\vec{U} \times \vec{V}) = \vec{V} \cdot \text{curl} \vec{U} - \vec{U} \cdot \text{curl} \vec{V}$. (M.U. 2003, 2005)

Solution. Let

$$\vec{U} = u_1 \hat{i} + u_2 \hat{j} + u_3 \hat{k}, \quad \vec{V} = v_1 \hat{i} + v_2 \hat{j} + v_3 \hat{k}$$

$$\vec{U} \times \vec{V} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix}$$

$$= (u_2 v_3 - u_3 v_2) \hat{i} - (u_1 v_3 - u_3 v_1) \hat{j} + (u_1 v_2 - u_2 v_1) \hat{k}$$

$$\text{div} (\vec{U} \times \vec{V}) = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot [(u_2 v_3 - u_3 v_2) \hat{i} - (u_1 v_3 - u_3 v_1) \hat{j} + (u_1 v_2 - u_2 v_1) \hat{k}]$$

$$= \frac{\partial}{\partial x} (u_2 v_3 - u_3 v_2) + \frac{\partial}{\partial y} (-u_1 v_3 + u_3 v_1) + \frac{\partial}{\partial z} (u_1 v_2 - u_2 v_1)$$

$$= \left[u_2 \frac{\partial v_3}{\partial x} + v_3 \frac{\partial u_2}{\partial x} - u_3 \frac{\partial v_2}{\partial x} - v_2 \frac{\partial u_3}{\partial x} \right] + \left[-u_1 \frac{\partial v_3}{\partial y} - v_3 \frac{\partial u_1}{\partial y} + u_3 \frac{\partial v_1}{\partial y} + v_1 \frac{\partial u_3}{\partial y} \right] + \left[u_1 \frac{\partial v_2}{\partial z} + v_2 \frac{\partial u_1}{\partial z} - u_2 \frac{\partial v_1}{\partial z} - v_1 \frac{\partial u_2}{\partial z} \right]$$

$$= v_1 \left(\frac{\partial u_3}{\partial y} - \frac{\partial u_2}{\partial z} \right) + v_2 \left(-\frac{\partial u_3}{\partial x} + \frac{\partial u_1}{\partial z} \right) + v_3 \left(\frac{\partial u_2}{\partial x} - \frac{\partial u_1}{\partial y} \right)$$

$$+ u_1 \left(-\frac{\partial v_3}{\partial y} + \frac{\partial v_2}{\partial z} \right) + u_2 \left(\frac{\partial v_3}{\partial x} - \frac{\partial v_1}{\partial z} \right) + u_3 \left(\frac{\partial v_1}{\partial y} - \frac{\partial v_2}{\partial x} \right)$$

$$= (v_1 \hat{i} + v_2 \hat{j} + v_3 \hat{k}) \cdot \left[\hat{i} \left(\frac{\partial u_3}{\partial y} - \frac{\partial u_2}{\partial z} \right) + \hat{j} \left(-\frac{\partial u_3}{\partial x} + \frac{\partial u_1}{\partial z} \right) + \hat{k} \left(\frac{\partial u_2}{\partial x} - \frac{\partial u_1}{\partial y} \right) \right]$$

$$- (u_1 \hat{i} + u_2 \hat{j} + u_3 \hat{k}) \cdot \left[\hat{i} \left(-\frac{\partial v_3}{\partial y} + \frac{\partial v_2}{\partial z} \right) + \hat{j} \left(\frac{\partial v_3}{\partial x} - \frac{\partial v_1}{\partial z} \right) + \hat{k} \left(\frac{\partial v_1}{\partial y} - \frac{\partial v_2}{\partial x} \right) \right]$$

$$= \vec{V} \cdot (\vec{\nabla} \times \vec{U}) - \vec{U} \cdot (\vec{\nabla} \times \vec{V}) = \vec{V} \cdot \text{curl} \vec{U} - \vec{U} \cdot \text{curl} \vec{V}$$

Proved.

Example 58. Prove that

$$\vec{\nabla} \times (\vec{F} \times \vec{G}) = \vec{F}(\vec{\nabla} \cdot \vec{G}) - \vec{G}(\vec{\nabla} \cdot \vec{F}) + (\vec{G} \cdot \vec{\nabla}) \vec{F} - (\vec{F} \cdot \vec{\nabla}) \vec{G} \quad (\text{M.U. 2004, 2005})$$

Solution.
$$\begin{aligned} \vec{\nabla} \times (\vec{F} \times \vec{G}) &= \Sigma \hat{i} \times \frac{\partial}{\partial x} (\vec{F} \times \vec{G}) \\ &= \Sigma \hat{i} \times \left(\frac{\partial F}{\partial x} \times \vec{G} + \vec{F} \times \frac{\partial G}{\partial x} \right) = \Sigma \hat{i} \times \left(\frac{\partial F}{\partial x} \times \vec{G} \right) + \Sigma \hat{i} \times \left(\vec{F} \times \frac{\partial G}{\partial x} \right) \\ &= \Sigma \left[(\hat{i} \cdot \vec{G}) \frac{\partial F}{\partial x} - \left(\hat{i} \frac{\partial F}{\partial x} \right) \vec{G} \right] + \Sigma \left[\left(\hat{i} \frac{\partial G}{\partial x} \right) \vec{F} - (\hat{i} \cdot \vec{F}) \frac{\partial G}{\partial x} \right] \\ &= \Sigma (\vec{G} \cdot \hat{i}) \frac{\partial F}{\partial x} - \vec{G} \Sigma \left(\hat{i} \frac{\partial F}{\partial x} \right) + \vec{F} \Sigma \left(\hat{i} \frac{\partial G}{\partial x} \right) - \Sigma (\vec{F} \cdot \hat{i}) \frac{\partial G}{\partial x} \\ &= \vec{F} \left(\Sigma \hat{i} \frac{\partial G}{\partial x} \right) - \vec{G} \Sigma \left(\hat{i} \frac{\partial F}{\partial x} \right) + \Sigma (\vec{G} \cdot \hat{i}) \frac{\partial F}{\partial x} - \Sigma (\vec{F} \cdot \hat{i}) \frac{\partial G}{\partial x} \\ &= \vec{F} (\vec{\nabla} \cdot \vec{G}) - \vec{G} (\vec{\nabla} \cdot \vec{F}) + (\vec{G} \cdot \vec{\nabla}) \vec{F} - (\vec{F} \cdot \vec{\nabla}) \vec{G} \end{aligned}$$

Proved.

Questions for practice:

Prove that

$$\vec{\nabla} (\vec{F} \cdot \vec{G}) = (\vec{G} \cdot \vec{\nabla}) \vec{F} + (\vec{F} \cdot \vec{\nabla}) \vec{G} + \vec{G} \times (\vec{\nabla} \times \vec{F}) + \vec{F} \times (\vec{\nabla} \times \vec{G})$$

Example 59. Prove that, for every field \vec{V} ; $\text{div curl } \vec{V} = 0$.

(Nagpur University, Summer 2004; AMIETE, Sem II, June 2010)

Solution. Let $V = V_1 \hat{i} + V_2 \hat{j} + V_3 \hat{k}$

$$\begin{aligned} \text{div} (\text{curl } \vec{V}) &= \vec{\nabla} \cdot (\vec{\nabla} \times \vec{V}) \\ &= \vec{\nabla} \cdot \left| \begin{array}{ccc} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ V_1 & V_2 & V_3 \end{array} \right| \\ &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot \left[\hat{i} \left(\frac{\partial V_3}{\partial y} - \frac{\partial V_2}{\partial z} \right) - \hat{j} \left(\frac{\partial V_3}{\partial x} - \frac{\partial V_1}{\partial z} \right) + \hat{k} \left(\frac{\partial V_2}{\partial x} - \frac{\partial V_1}{\partial y} \right) \right] \\ &= \frac{\partial}{\partial x} \left(\frac{\partial V_3}{\partial y} - \frac{\partial V_2}{\partial z} \right) - \frac{\partial}{\partial y} \left(\frac{\partial V_3}{\partial x} - \frac{\partial V_1}{\partial z} \right) + \frac{\partial}{\partial z} \left(\frac{\partial V_2}{\partial x} - \frac{\partial V_1}{\partial y} \right) \\ &= \frac{\partial^2 V_3}{\partial x \partial y} - \frac{\partial^2 V_2}{\partial x \partial z} - \frac{\partial^2 V_3}{\partial y \partial x} + \frac{\partial^2 V_1}{\partial y \partial z} + \frac{\partial^2 V_2}{\partial z \partial x} - \frac{\partial^2 V_1}{\partial z \partial y} \\ &= \left(\frac{\partial^2 V_1}{\partial y \partial z} - \frac{\partial^2 V_1}{\partial z \partial y} \right) + \left(\frac{\partial^2 V_2}{\partial z \partial x} - \frac{\partial^2 V_2}{\partial x \partial z} \right) + \left(\frac{\partial^2 V_3}{\partial x \partial y} - \frac{\partial^2 V_3}{\partial y \partial x} \right) \\ &= 0 \end{aligned}$$

Ans.

Example 60. If \vec{a} is a constant vector, show that

$$\vec{a} \times (\vec{\nabla} \times \vec{r}) = \vec{\nabla}(\vec{a} \cdot \vec{r}) - (\vec{a} \cdot \vec{\nabla}) \vec{r}. \quad (\text{U.P., 1st Semester, Dec. 2007})$$

Solution. $\vec{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}, \quad \vec{r} = r_1 \hat{i} + r_2 \hat{j} + r_3 \hat{k}$

$$\begin{aligned}
\vec{\nabla} \times \vec{r} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ r_1 & r_2 & r_3 \end{vmatrix} = \left(\frac{\partial r_3}{\partial y} - \frac{\partial r_2}{\partial z} \right) \hat{i} - \left(\frac{\partial r_3}{\partial x} - \frac{\partial r_1}{\partial z} \right) \hat{j} + \left(\frac{\partial r_2}{\partial x} - \frac{\partial r_1}{\partial y} \right) \hat{k} \\
\vec{a} \times (\vec{\nabla} \times \vec{r}) &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ \frac{\partial r_3}{\partial y} - \frac{\partial r_2}{\partial z} & -\frac{\partial r_3}{\partial x} + \frac{\partial r_1}{\partial z} & \frac{\partial r_2}{\partial x} - \frac{\partial r_1}{\partial y} \end{vmatrix} \\
&= \left[\left(a_2 \frac{\partial r_2}{\partial x} - a_2 \frac{\partial r_1}{\partial y} \right) - \left(-a_3 \frac{\partial r_3}{\partial x} + a_3 \frac{\partial r_1}{\partial z} \right) \right] \hat{i} - \left[a_1 \frac{\partial r_2}{\partial x} - a_1 \frac{\partial r_1}{\partial y} - a_3 \frac{\partial r_3}{\partial y} + a_3 \frac{\partial r_2}{\partial z} \right] \hat{j} \\
&\quad + \left[-a_1 \frac{\partial r_3}{\partial x} + a_1 \frac{\partial r_1}{\partial z} - a_2 \frac{\partial r_3}{\partial y} + a_2 \frac{\partial r_2}{\partial z} \right] \hat{k} \\
&= \left[\left(a_1 \hat{i} \frac{\partial r_1}{\partial x} + a_2 \hat{i} \frac{\partial r_2}{\partial x} + a_3 \hat{i} \frac{\partial r_3}{\partial x} \right) + \left(a_1 \hat{j} \frac{\partial r_1}{\partial y} + a_2 \hat{j} \frac{\partial r_2}{\partial y} + a_3 \hat{j} \frac{\partial r_3}{\partial y} \right) \right. \\
&\quad \left. + \left(a_1 \hat{k} \frac{\partial r_1}{\partial z} + a_2 \hat{k} \frac{\partial r_2}{\partial z} + a_3 \hat{k} \frac{\partial r_3}{\partial z} \right) \right] - \left[\left(a_1 \hat{i} \frac{\partial r_1}{\partial x} + a_1 \hat{j} \frac{\partial r_2}{\partial x} + a_1 \hat{k} \frac{\partial r_3}{\partial x} \right) \right. \\
&\quad \left. + \left(a_2 \hat{i} \frac{\partial r_1}{\partial y} + a_2 \hat{j} \frac{\partial r_2}{\partial y} + a_2 \hat{k} \frac{\partial r_3}{\partial y} \right) + \left(a_3 \hat{i} \frac{\partial r_1}{\partial z} + a_3 \hat{j} \frac{\partial r_2}{\partial z} + a_3 \hat{k} \frac{\partial r_3}{\partial z} \right) \right] \\
&= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (a_1 r_1 + a_2 r_2 + a_3 r_3) - \left[a_1 \frac{\partial}{\partial x} + a_2 \frac{\partial}{\partial y} + a_3 \frac{\partial}{\partial z} \right] (r_1 \hat{i} + r_2 \hat{j} + r_3 \hat{k}) \\
&= \vec{\nabla}(a \cdot \vec{r}) - (a \cdot \vec{\nabla}) \vec{r}
\end{aligned}$$

Proved.

Example 61. If r is the distance of a point (x, y, z) from the origin, prove that $\text{curl} \left(k \times \text{grad} \frac{1}{r} \right) + \text{grad} \left(k \cdot \text{grad} \frac{1}{r} \right) = 0$, where k is the unit vector in the direction OZ . (U.P., I Semester, Winter 2000)

Solution.

$$r^2 = (x - 0)^2 + (y - 0)^2 + (z - 0)^2 = x^2 + y^2 + z^2$$

$$\Rightarrow$$

$$\begin{aligned}
\frac{1}{r} &= (x^2 + y^2 + z^2)^{-1/2} \\
\text{grad} \frac{1}{r} &= \vec{\nabla} \frac{1}{r} = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2)^{-1/2} \\
&= -\frac{1}{2} (x^2 + y^2 + z^2)^{-3/2} (2x \hat{i} + 2y \hat{j} + 2z \hat{k}) \\
&= -(x^2 + y^2 + z^2)^{-3/2} (x \hat{i} + y \hat{j} + z \hat{k}) \\
k \times \text{grad} \frac{1}{r} &= k \times [-(x^2 + y^2 + z^2)^{-3/2} (x \hat{i} + y \hat{j} + z \hat{k})] \\
&= -(x^2 + y^2 + z^2)^{-3/2} (x \hat{j} - y \hat{i}) \\
\text{curl} \left(k \times \text{grad} \frac{1}{r} \right) &= \vec{\nabla} \times \left(k \times \text{grad} \frac{1}{r} \right)
\end{aligned}$$

$$\begin{aligned}
&= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [-(x^2 + y^2 + z^2)^{-3/2} (x \hat{j} - y \hat{i})] \\
&= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{y}{(x^2 + y^2 + z^2)^{3/2}} & \frac{-x}{(x^2 + y^2 + z^2)^{3/2}} & 0 \end{vmatrix} \\
&= -\left(-\frac{3}{2}\right) \frac{(-x)(2z)}{(x^2 + y^2 + z^2)^{5/2}} \hat{i} + -\frac{3}{2} \frac{y(2z)}{(x^2 + y^2 + z^2)^{5/2}} \hat{j} + \left[-\frac{3}{2} \frac{(-x)(2x)}{(x^2 + y^2 + z^2)^{5/2}} \right. \\
&\quad \left. - \frac{1}{(x^2 + y^2 + z^2)^{3/2}} - \frac{(-3/2)(y)(2y)}{(x^2 + y^2 + z^2)^{5/2}} - \frac{1}{(x^2 + y^2 + z^2)^{3/2}} \right] \hat{k} \\
&= \frac{-3xz}{(x^2 + y^2 + z^2)^{5/2}} \hat{i} - \frac{3yz}{(x^2 + y^2 + z^2)^{5/2}} \hat{j} + \frac{(3x^2 - x^2 - y^2 - z^2 + 3y^2 - x^2 - y^2 - z^2)}{(x^2 + y^2 + z^2)^{5/2}} \hat{k} \\
&= \frac{-3xz \hat{i} - 3yz \hat{j} + (x^2 + y^2 - 2z^2) \hat{k}}{(x^2 + y^2 + z^2)^{5/2}} \quad \dots(1) \\
k \cdot \text{grad} \frac{1}{r} &= k \cdot [-(x^2 + y^2 + z^2)^{-3/2} (x \hat{i} + y \hat{j} + z \hat{k})] = \frac{-z}{(x^2 + y^2 + z^2)^{3/2}} \\
\text{grad} \left(k \cdot \text{grad} \frac{1}{r} \right) &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \frac{-z}{(x^2 + y^2 + z^2)^{3/2}} \\
&= -\frac{3}{2} \frac{\hat{i}(-z)(2x)}{(x^2 + y^2 + z^2)^{5/2}} + -\frac{3}{2} \frac{\hat{j}(-z)(2y)}{(x^2 + y^2 + z^2)^{5/2}} \\
&\quad + \left[-\frac{3}{2} \frac{(-z)(2z)}{(x^2 + y^2 + z^2)^{5/2}} - \frac{1}{(x^2 + y^2 + z^2)^{3/2}} \right] \hat{k} \\
&= \frac{3xz \hat{i} + 3yz \hat{j} + (3z^2 - x^2 - y^2 - z^2) \hat{k}}{(x^2 + y^2 + z^2)^{5/2}} = \frac{3xz \hat{i} + 3yz \hat{j} - (x^2 + y^2 - 2z^2) \hat{k}}{(x^2 + y^2 + z^2)^{5/2}} \quad \dots(2)
\end{aligned}$$

Adding (1) and (2), we get

$$\text{Curl} \left(k \times \text{grad} \frac{1}{r} \right) + \text{grad} \left(k \cdot \text{grad} \frac{1}{r} \right) = 0 \quad \text{Proved.}$$

$$\begin{aligned}
\text{Example 62. Prove that } \nabla \times \left(\frac{\vec{a} \times \vec{r}}{r^n} \right) &= \frac{(2-n)\vec{a}}{r^n} + \frac{n(\vec{a} \cdot \vec{r})\vec{r}}{r^{n+2}}. \\
&\quad (M.U. 2009, 2005, 2003, 2002; AMIETE, II Sem. June 2010)
\end{aligned}$$

Solution. We have,

$$\begin{aligned}
\frac{\vec{a} \times \vec{r}}{r^n} &= \frac{1}{r^n} \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a_1 & a_2 & a_3 \\ x & y & z \end{vmatrix} \\
&= \frac{1}{r^n} (a_2 z - a_3 y) \hat{i} + \frac{1}{r^n} (a_3 x - a_1 z) \hat{j} + \frac{1}{r^n} (a_1 y - a_2 x) \hat{k}
\end{aligned}$$

$$\begin{aligned}\nabla \times \frac{(\vec{a} \times \vec{r})}{r^n} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{a_2 z - a_3 y}{r^n} & \frac{a_3 x - a_1 z}{r^n} & \frac{a_1 y - a_2 x}{r^n} \end{vmatrix} \\ &= \hat{i} \left[\frac{\partial}{\partial y} \left(\frac{a_1 y - a_2 x}{r^n} \right) - \frac{\partial}{\partial z} \left(\frac{a_3 x - a_1 z}{r^n} \right) \right] - \hat{j} \left[\frac{\partial}{\partial x} \left(\frac{a_1 y - a_2 x}{r^n} \right) - \frac{\partial}{\partial z} \left(\frac{a_2 z - a_3 y}{r^n} \right) \right] \\ &\quad + \hat{k} \left[\frac{\partial}{\partial x} \left(\frac{a_3 x - a_1 z}{r^n} \right) - \frac{\partial}{\partial y} \left(\frac{a_2 z - a_3 y}{r^n} \right) \right]\end{aligned}$$

$$\text{Now, } r^2 = x^2 + y^2 + z^2 \Rightarrow 2r \frac{\partial r}{\partial x} = 2x \Rightarrow \frac{\partial r}{\partial x} = \frac{x}{r}$$

$$\text{Similarly, } \frac{\partial r}{\partial y} = \frac{y}{r}, \quad \frac{\partial r}{\partial z} = \frac{z}{r}$$

$$\begin{aligned}\therefore \nabla \times \left(\frac{\vec{a} \times \vec{r}}{r^n} \right) &= \hat{i} \left[\left\{ -nr^{-n-1} \left(\frac{y}{r} \right) (a_1 y - a_2 x) + \frac{1}{r^n} a_1 \right\} \right. \\ &\quad \left. - \left\{ -nr^{-n-1} \left(\frac{z}{r} \right) (a_3 x - a_1 z) + \frac{1}{r^n} (-a_1) \right\} \right] + \text{two similar terms} \\ &= \hat{i} \left[-\frac{n}{r^{n+2}} (a_1 y^2 - a_2 x y) + \frac{a_1}{r^n} + \frac{n}{r^{n+2}} (a_3 x z - a_1 z^2) + \frac{a_1}{r^n} \right] \\ &\quad + \text{two similar terms} \\ &= \hat{i} \left[\frac{2a_1}{r^n} - \frac{n}{r^{n+2}} a_1 (y^2 + z^2) + \frac{n}{r^{n+2}} (a_2 x y + a_3 x z) \right] + \text{two similar terms}\end{aligned}$$

Adding and subtracting $\frac{n}{r^{n+2}} a_1 x^2$ to third and from second term, we get

$$\begin{aligned}\nabla \times \left(\frac{\vec{a} \times \vec{r}}{r^n} \right) &= \hat{i} \left[\frac{2a_1}{r^n} - \frac{na_1}{r^{n+2}} (x^2 + y^2 + z^2) + \frac{n}{r^{n+2}} (a_1 x^2 + a_2 x y + a_3 x z) \right] \\ &\quad + \text{two similar terms} \\ &= \hat{i} \left[\frac{2a_1}{r^n} - \frac{na_1}{r^{n+2}} r^2 + \frac{n}{r^{n+2}} x (a_1 x + a_2 y + a_3 z) \right] + \text{two similar terms} \\ &= \hat{i} \left[\frac{2a_1}{r^n} - \frac{na_1}{r^n} + \frac{n}{r^{n+2}} x (a_1 x + a_2 y + a_3 z) \right] + \hat{j} \left[\frac{2a_2}{r^n} - \frac{na_2}{r^n} + \frac{n}{r^{n+2}} y (a_2 y + a_3 z + a_1 x) \right] \\ &\quad + \hat{k} \left[\frac{2a_3}{r^n} - \frac{na_3}{r^n} + \frac{n}{r^{n+2}} z (a_3 z + a_1 x + a_2 y) \right] \\ &= \frac{2}{r^n} (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) - \frac{n}{r^n} (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) + \frac{n}{r^{n+2}} (a_1 x + a_2 y + a_3 z) (x \hat{i} + y \hat{j} + z \hat{k}) \\ &= \frac{2-n}{r^n} (a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}) + \frac{n}{r^{n+2}} (a_1 x + a_2 y + a_3 z) (x \hat{i} + y \hat{j} + z \hat{k}) \\ &= \frac{2-n}{r^n} \vec{a} + \frac{n}{r^{n+2}} (\vec{a} \cdot \vec{r}) \vec{r}\end{aligned}$$

Proved.

Example 63. If f and g are two scalar point functions, prove that

$$\operatorname{div}(f \nabla g) = f \nabla^2 g + \nabla f \nabla g. \quad (\text{U.P., I Semester, compartment, Winter 2001})$$

Solution. We have, $\nabla g = \frac{\partial g}{\partial x} \hat{i} + \frac{\partial g}{\partial y} \hat{j} + \frac{\partial g}{\partial z} \hat{k}$

$$\Rightarrow f \nabla g = f \frac{\partial g}{\partial x} \hat{i} + f \frac{\partial g}{\partial y} \hat{j} + f \frac{\partial g}{\partial z} \hat{k}$$

$$\Rightarrow \operatorname{div}(f \nabla g) = \frac{\partial}{\partial x} \left(f \frac{\partial g}{\partial x} \right) + \frac{\partial}{\partial y} \left(f \frac{\partial g}{\partial y} \right) + \frac{\partial}{\partial z} \left(f \frac{\partial g}{\partial z} \right)$$

$$= f \left(\frac{\partial^2 g}{\partial x^2} + \frac{\partial^2 g}{\partial y^2} + \frac{\partial^2 g}{\partial z^2} \right) + \left(\frac{\partial f}{\partial x} \frac{\partial g}{\partial x} + \frac{\partial f}{\partial y} \frac{\partial g}{\partial y} + \frac{\partial f}{\partial z} \frac{\partial g}{\partial z} \right)$$

$$= f \left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2} \right) g + \left(\frac{\partial f}{\partial x} \hat{i} + \frac{\partial f}{\partial y} \hat{j} + \frac{\partial f}{\partial z} \hat{k} \right) \cdot \left(\frac{\partial g}{\partial x} \hat{i} + \frac{\partial g}{\partial y} \hat{j} + \frac{\partial g}{\partial z} \hat{k} \right)$$

$$= f \nabla^2 g + \nabla f \cdot \nabla g$$

Proved.

Example 64. For a solenoidal vector \vec{F} , show that $\operatorname{curl} \operatorname{curl} \operatorname{curl} \operatorname{curl} \vec{F} = \nabla^4 \vec{F}$.

(M.D.U., Dec. 2009)

Solution. Since vector \vec{F} is solenoidal, so $\operatorname{div} \vec{F} = 0$... (1)

We know that $\operatorname{curl} \operatorname{curl} \vec{F} = \operatorname{grad} \operatorname{div} (\vec{F} - \nabla^2 \vec{F})$... (2)

Using (1) in (2), $\operatorname{grad} \operatorname{div} \vec{F} = \operatorname{grad} (0) = 0$... (3)

On putting the value of $\operatorname{grad} \operatorname{div} \vec{F}$ in (2), we get

$\operatorname{curl} \operatorname{curl} \vec{F} = -\nabla^2 \vec{F}$... (4)

Now, $\operatorname{curl} \operatorname{curl} \operatorname{curl} \operatorname{curl} \vec{F} = \operatorname{curl} \operatorname{curl} (-\nabla^2 \vec{F})$ [Using (4)]

$= -\operatorname{curl} \operatorname{curl} (\nabla^2 \vec{F}) = -[\operatorname{grad} \operatorname{div} (\nabla^2 \vec{F}) - \nabla^2 (\nabla^2 \vec{F})]$ [Using (2)]

$= -\operatorname{grad} (\nabla \cdot \nabla^2 \vec{F}) + \nabla^2 (\nabla^2 \vec{F}) = -\operatorname{grad} (\nabla^2 \nabla \cdot \vec{F}) + \nabla^4 \vec{F}$ [$\nabla \cdot \vec{F} = 0$]

$= 0 + \nabla^4 \vec{F} = \nabla^4 \vec{F}$ [Using (1)]

Proved.

EXERCISE 5.9

1. Find the divergence and curl of the vector field $V = (x^2 - y^2) \hat{i} + 2xy \hat{j} + (y^2 - xy) \hat{k}$.

Ans. Divergence = $4x$, Curl = $(2y - x) \hat{i} + y \hat{j} + 4y \hat{k}$

2. If a is constant vector and r is the radius vector, prove that

$$(i) \nabla(\vec{a} \cdot \vec{r}) = \vec{a} \quad (ii) \operatorname{div}(\vec{r} \times \vec{a}) = 0 \quad (iii) \operatorname{curl}(\vec{r} \times \vec{a}) = -2\vec{a}$$

where $\vec{r} = x \hat{i} + y \hat{j} + z \hat{k}$ and $\vec{a} = a_1 \hat{i} + a_2 \hat{j} + a_3 \hat{k}$.

3. Prove that:

$$(i) \nabla(\phi A) = \nabla\phi \cdot A + \phi(\nabla \cdot A)$$

$$(ii) \nabla(A \cdot B) = (A \cdot \nabla)B + (B \cdot \nabla)A + A \times (\nabla \times B) + B \times (\nabla \times A) \quad (\text{R.G.P.V. Bhopal, June 2004})$$

$$(iii) \nabla \times (A \times B) = (B \cdot \nabla)A - (A \cdot \nabla)B + A(\nabla \cdot B)$$

4. If $F = (x + y + 1) \hat{i} + \hat{j} - (x + y) \hat{k}$, show that $F \cdot \operatorname{curl} F = 0$.

(R.G.P.V. Bhopal, Feb. 2006, June 2004)

Prove that

$$5. \nabla \times (\phi \vec{F}) = (\nabla \phi) \times \vec{F} + \phi(\nabla \times \vec{F})$$

$$6. \nabla \cdot (\vec{F} \times \vec{G}) = \vec{G} \cdot (\nabla \times \vec{F}) - \vec{F} \cdot (\nabla \times \vec{G})$$

7. Evaluate $\operatorname{div}(\vec{A} \times \vec{r})$ if $\operatorname{curl} \vec{A} = 0$.

8. Prove that $\operatorname{curl}(\vec{a} \times \vec{r}) = 2a$

9. Find $\operatorname{div} \vec{F}$ and $\operatorname{curl} \vec{F}$ where $\vec{F} = \operatorname{grad} (x^3 + y^3 + z^3 - 3xyz)$. (R.G.P.V. Bhopal Dec. 2003)

Ans. $\operatorname{div} \vec{F} = 6(x + y + z)$, $\operatorname{curl} \vec{F} = 0$

10. Find out values of a, b, c for which $\vec{v} = (x + y + az)\hat{i} + (bx + 3y - z)\hat{j} + (3x + cy + z)\hat{k}$ is irrotational.

Ans. $a = 3, b = 1, c = -1$

11. Determine the constants a, b, c , so that $\vec{F} = (x + 2y + az)\hat{i} + (bx - 3y - z)\hat{j} + (4x + cy + 2z)\hat{k}$ is irrotational. Hence find the scalar potential ϕ such that $\vec{F} = \operatorname{grad} \phi$. (R.G.P.V. Bhopal, Feb. 2005)

Ans. $a = 4, b = 2, c = 1$

Potential $\phi = \left(\frac{x^2}{2} - \frac{3y^2}{2} + z^2 + 2xy - yz + 4zx \right)$

Choose the correct alternative:

12. The magnitude of the vector drawn in a direction perpendicular to the surface $x^2 + 2y^2 + z^2 = 7$ at the point $(1, -1, 2)$ is

(i) $\frac{2}{3}$ (ii) $\frac{3}{2}$ (iii) 3 (iv) 6 (A.M.I.E.T.E., Summer 2000) **Ans.** (iv)

13. If $u = x^2 - y^2 + z^2$ and $\vec{V} = x\hat{i} + y\hat{j} + z\hat{k}$ then $\nabla(u\vec{V})$ is equal to

(i) $5u$ (ii) $5|\vec{V}|$ (iii) $5(u - |\vec{V}|)$ (iv) $5(u + |\vec{V}|)$ (A.M.I.E.T.E., June 2007)

14. A unit normal to $x^2 + y^2 + z^2 = 5$ at $(0, 1, 2)$ is equal to

(i) $\frac{1}{\sqrt{5}}(\hat{i} + \hat{j} + \hat{k})$ (ii) $\frac{1}{\sqrt{5}}(\hat{i} + \hat{j} - \hat{k})$ (iii) $\frac{1}{\sqrt{5}}(\hat{j} + 2\hat{k})$ (iv) $\frac{1}{\sqrt{5}}(\hat{i} - \hat{j} + \hat{k})$ (A.M.I.E.T.E., Dec. 2008)

15. The directional derivative of $\phi = xyz$ at the point $(1, 1, 1)$ in the direction \hat{i} is:

(i) -1 (ii) $-\frac{1}{3}$ (iii) 1 (iv) $\frac{1}{3}$ (A.M.I.E.T.E., June 2007)

(R.G.P.V. Bhopal, II Sem., June 2007)

16. If $\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$ and $r = |\vec{r}|$ then $\nabla\phi(r)$ is:

(i) $\phi'(r)\frac{\vec{r}}{r}$ (ii) $\frac{\phi(r)\vec{r}}{r}$ (iii) $\frac{\phi'(r)\vec{r}}{r}$ (iv) None of these (A.M.I.E.T.E., June 2007)

(R.G.P.V. Bhopal, II Semester, Feb. 2006)

17. If $\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$ is position vector, then value of $\nabla(\log r)$ is (U.P., I Sem, Dec 2008)

(i) $\frac{\vec{r}}{r}$ (ii) $\frac{\vec{r}}{r^2}$ (iii) $-\frac{\vec{r}}{r^3}$ (iv) none of the above. (A.M.I.E.T.E., June 2007)

18. If $\vec{r} = x\hat{i} + y\hat{j} + z\hat{k}$ and $|\vec{r}| = r$, then $\operatorname{div} \vec{r}$ is:

(i) 2 (ii) 3 (iii) -3 (iv) -2 (A.M.I.E.T.E., June 2007)

(R.G.P.V. Bhopal, II Semester, Feb. 2006)

19. If $\vec{V} = xy^2\hat{i} + 2yx^2z\hat{j} - 3yz^2\hat{k}$ then $\operatorname{curl} \vec{V}$ at point $(1, -1, 1)$ is

(i) $-(\hat{j} + 2\hat{k})$ (ii) $(\hat{i} + 3\hat{k})$ (iii) $-(\hat{i} + 2\hat{k})$ (iv) $(\hat{i} + 2\hat{j} + \hat{k})$ (R.G.P.V. Bhopal, II Semester, Feb. 2006)

Ans. (iii)

20. If \vec{A} is such that $\nabla \times \vec{A} = 0$ then \vec{A} is called

(i) Irrotational (ii) Solenoidal (iii) Rotational (iv) None of these (A.M.I.E.T.E., Dec. 2008)

21. If \vec{F} is a conservative force field, then the value of $\operatorname{curl} \vec{F}$ is

(i) 0 (ii) 1 (iii) ∇F (iv) -1 (A.M.I.E.T.E., June 2007)

22. If $\nabla^2 [(1-x)(1-2x)]$ is equal to
 (i) 2 (ii) 3 (iii) 4 (iv) 6 (A.M.I.E.T.E., Dec. 2009) **Ans. (iii)**

23. If $\vec{R} = xi + yj + zk$ and \vec{A} is a constant vector, $\operatorname{curl}(\vec{A} \times \vec{R})$ is equal to

(i) \vec{R} (ii) $2\vec{R}$ (iii) \vec{A} (iv) $2\vec{A}$ (A.M.I.E.T.E., Dec. 2009) **Ans. (iv)**

24. If r is the distance of a point (x, y, z) from the origin, the value of the expression $\hat{j} \times \operatorname{grad} \frac{1}{2}$ equals

(i) $(x^2 + y^2 + z^2)^{-\frac{3}{2}} (\hat{j}z - \hat{k}x)$ (ii) $(x^2 + y^2 + z^2)^{-\frac{3}{2}} (\hat{j}z - \hat{i}z)$

(iii) zero (iv) $(x^2 + y^2 + z^2)^{-\frac{3}{2}} (\hat{j}y - \hat{k}x)$

(AMIETE, Dec. 2010) **Ans. (ii)**

5.33 LINE INTEGRAL

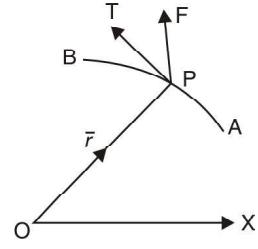

Let $\vec{F}(x, y, z)$ be a vector function and a curve AB .

Line integral of a vector function \vec{F} along the curve AB is defined as integral of the component of \vec{F} along the tangent to the curve AB .

Component of \vec{F} along a tangent PT at P

= Dot product of \vec{F} and unit vector along PT

= $\vec{F} \cdot \frac{\vec{dr}}{ds} \left(\frac{\vec{dr}}{ds} \text{ is a unit vector along tangent } PT \right)$

Line integral = $\sum \vec{F} \cdot \frac{\vec{dr}}{ds}$ from A to B along the curve

\therefore Line integral = $\int_c \left(\vec{F} \cdot \frac{\vec{dr}}{ds} \right) ds = \int_c \vec{F} \cdot \vec{dr}$

Note (1) Work. If \vec{F} represents the variable force acting on a particle along arc AB, then the total work done = $\int_A^B \vec{F} \cdot \vec{dr}$

(2) Circulation. If \vec{V} represents the velocity of a liquid then $\oint_c \vec{V} \cdot \vec{dr}$ is called the circulation of V round the closed curve c .

If the circulation of V round every closed curve is zero then V is said to be irrotational there.

(3) When the path of integration is a closed curve then notation of integration is \oint in place of \int .

Example 65. If a force $\vec{F} = 2x^2 y \hat{i} + 3xy \hat{j}$ displaces a particle in the xy -plane from $(0, 0)$ to $(1, 4)$ along a curve $y = 4x^2$. Find the work done.

Solution. Work done = $\int_c \vec{F} \cdot \vec{dr}$

$$= \int_c (2x^2 y \hat{i} + 3xy \hat{j}) \cdot (dx \hat{i} + dy \hat{j})$$

$$= \int_c (2x^2 y dx + 3xy dy)$$

$$\left[\begin{array}{l} \vec{r} = x \hat{i} + y \hat{j} \\ \vec{dr} = dx \hat{i} + dy \hat{j} \end{array} \right]$$

Putting the values of y and dy , we get

$$\begin{aligned}
 &= \int_0^1 [2x^2(4x^2)dx + 3x(4x^2)8x dx] \\
 &= 104 \int_0^1 x^4 dx = 104 \left(\frac{x^5}{5} \right)_0^1 = \frac{104}{5}
 \end{aligned}
 \quad \text{Ans.}$$

Example 66. Evaluate $\int_C \vec{F} \cdot d\vec{r}$ where $\vec{F} = x^2\hat{i} + xy\hat{j}$ and C is the boundary of the square in the plane $z = 0$ and bounded by the lines $x = 0$, $y = 0$, $x = a$ and $y = a$.

(Nagpur University, Summer 2001)

Solution. $\int_C \vec{F} \cdot d\vec{r} = \int_{OA} \vec{F} \cdot d\vec{r} + \int_{AB} \vec{F} \cdot d\vec{r} + \int_{BC} \vec{F} \cdot d\vec{r} + \int_{CO} \vec{F} \cdot d\vec{r}$

Here $\vec{r} = x\hat{i} + y\hat{j}$, $d\vec{r} = dx\hat{i} + dy\hat{j}$, $\vec{F} = x^2\hat{i} + xy\hat{j}$

$$\vec{F} \cdot d\vec{r} = x^2 dx + xy dy \quad \dots(1)$$

On $OA, y = 0$

$$\therefore \vec{F} \cdot d\vec{r} = x^2 dx$$

$$\int_{OA} \vec{F} \cdot d\vec{r} = \int_0^a x^2 dx = \left[\frac{x^3}{3} \right]_0^a = \frac{a^3}{3} \quad \dots(2)$$

On $AB, x = a$

(1) becomes

$$\therefore dx = 0$$

$$\therefore \vec{F} \cdot d\vec{r} = ay dy$$

$$\int_{AB} \vec{F} \cdot d\vec{r} = \int_0^a ay dy = a \left[\frac{y^2}{2} \right]_0^a = \frac{a^3}{2} \quad \dots(3)$$

On $BC, y = a$

\Rightarrow (1) becomes

$$\therefore dy = 0$$

$$\therefore \vec{F} \cdot d\vec{r} = x^2 dx$$

$$\int_{BC} \vec{F} \cdot d\vec{r} = \int_a^0 x^2 dx = \left[\frac{x^3}{3} \right]_a^0 = -\frac{a^3}{3} \quad \dots(4)$$

On $CO, x = 0$,

(1) becomes

$$\therefore \vec{F} \cdot d\vec{r} = 0$$

$$\int_{CO} \vec{F} \cdot d\vec{r} = 0 \quad \dots(5)$$

On adding (2), (3), (4) and (5), we get $\int_C \vec{F} \cdot d\vec{r} = \frac{a^3}{3} + \frac{a^3}{2} - \frac{a^3}{3} + 0 = \frac{a^3}{2}$ Ans.

Example 67. A vector field is given by

$$\vec{F} = (2y+3)\hat{i} + xz\hat{j} + (yz-x)\hat{k}. \text{ Evaluate } \int_C \vec{F} \cdot d\vec{r} \text{ along the path } C \text{ is } x = 2t,$$

$y = t, z = t^3$ from $t = 0$ to $t = 1$. (Nagpur University, Winter 2003)

Solution. $\int_C \vec{F} \cdot d\vec{r} = \int_C (2y+3) dx + (xz) dy + (yz-x) dz$

$\left[\begin{array}{l} \text{Since } x = 2t \quad y = t \quad z = t^3 \\ \therefore \frac{dx}{dt} = 2 \quad \frac{dy}{dt} = 1 \quad \frac{dz}{dt} = 3t^2 \end{array} \right]$

$$\begin{aligned}
&= \int_0^1 (2t+3)(2dt) + (2t)(t^3)dt + (t^4 - 2t)(3t^2)dt = \int_0^1 (4t+6+2t^4+3t^6-6t^3)dt \\
&= \left[4\frac{t^2}{2} + 6t + \frac{2}{5}t^5 + \frac{3}{7}t^7 - \frac{6}{4}t^4 \right]_0^1 = \left[2t^2 + 6t + \frac{2}{5}t^5 + \frac{3}{7}t^7 - \frac{3}{2}t^4 \right]_0^1 \\
&= 2 + 6 + \frac{2}{5} + \frac{3}{7} - \frac{3}{2} = 7.32857. \tag{Ans.}
\end{aligned}$$

Example 68. The acceleration of a particle at time t is given by

$$\vec{a} = 18 \cos 3t \hat{i} - 8 \sin 2t \hat{j} + 6t \hat{k}.$$

If the velocity \vec{v} and displacement \vec{r} be zero at $t = 0$, find \vec{v} and \vec{r} at any point t .

Solution. Here, $\vec{a} = \frac{d^2 \vec{r}}{dt^2} = 18 \cos 3t \hat{i} - 8 \sin 2t \hat{j} + 6t \hat{k}$.

On integrating, we have

$$\begin{aligned}
\vec{v} &= \frac{d\vec{r}}{dt} = \hat{i} \int 18 \cos 3t dt + \hat{j} \int -8 \sin 2t dt + \hat{k} \int 6t dt \\
\Rightarrow \vec{v} &= 6 \sin 3t \hat{i} + 4 \cos 2t \hat{j} + 3t^2 \hat{k} + \vec{c} \tag{...1}
\end{aligned}$$

At $t = 0$, $\vec{v} = \vec{0}$

Putting $t = 0$ and $\vec{v} = 0$ in (1), we get

$$\vec{0} = 4\hat{j} + \vec{c} \Rightarrow \vec{c} = -4\hat{j}$$

$$\therefore \vec{v} = \frac{d\vec{r}}{dt} = 6 \sin 3t \hat{i} + 4(\cos 2t - 1) \hat{j} + 3t^2 \hat{k}$$

Again integrating, we have

$$\begin{aligned}
\vec{r} &= \hat{i} \int 6 \sin 3t dt + \hat{j} \int 4(\cos 2t - 1) dt + \hat{k} \int 3t^2 dt \\
\Rightarrow \vec{r} &= -2 \cos 3t \hat{i} + (2 \sin 2t - 4t) \hat{j} + t^3 \hat{k} + \vec{C}_1 \tag{...2}
\end{aligned}$$

At, $t = 0$, $\vec{r} = 0$

Putting $t = 0$ and $\vec{r} = 0$ in (2), we get

$$\vec{0} = -2\hat{i} + \vec{C}_1 \Rightarrow \vec{C}_1 = 2\hat{i}$$

$$\text{Hence, } \vec{r} = 2(1 - \cos 3t) \hat{i} + 2(\sin 2t - 2t) \hat{j} + t^3 \hat{k} \tag{Ans.}$$

Example 69. If $\vec{A} = (3x^2 + 6y) \hat{i} - 14yz\hat{j} + 20xz^2 \hat{k}$, evaluate the line integral $\oint_C \vec{A} \cdot d\vec{r}$ from $(0, 0, 0)$ to $(1, 1, 1)$ along the curve C .

$$x = t, y = t^2, z = t^3.$$

(Uttarakhand, I Semester, Dec. 2006)

Solution. We have,

$$\begin{aligned}
\int_C \vec{A} \cdot d\vec{r} &= \int_C [(3x^2 + 6y) \hat{i} - 14yz\hat{j} + 20xz^2 \hat{k}] \cdot [\hat{i} dx + \hat{j} dy + \hat{k} dz] \\
&= \int_C [(3x^2 + 6y) dx - 14yz dy + 20xz^2 dz]
\end{aligned}$$

If $x = t$, $y = t^2$, $z = t^3$, then points $(0, 0, 0)$ and $(1, 1, 1)$ correspond to $t = 0$ and $t = 1$ respectively.

$$\begin{aligned}
\text{Now, } \int_C \vec{A} \cdot d\vec{r} &= \int_{t=0}^{t=1} [(3t^2 + 6t^2) d(t) - 14t^2 t^3 d(t^2) + 20t(t^3)^2 d(t^3)] \\
&= \int_{t=0}^{t=1} [9t^2 dt - 14t^5 \cdot 2t dt + 20t^7 \cdot 3t^2 dt] = \int_0^1 (9t^2 - 28t^6 + 60t^9) dt
\end{aligned}$$

$$= \left[9\left(\frac{t^3}{3}\right) - 28\left(\frac{t^7}{7}\right) + 60\left(\frac{t^{10}}{10}\right) \right]_0^1 = 3 - 4 + 6 = 5 \quad \text{Ans.}$$

Example 70. Evaluate $\iint_S \vec{A} \cdot \hat{n} ds$ where $\vec{A} = (x + y^2) \hat{i} - 2x \hat{j} + 2yz \hat{k}$ and S is the surface of the plane $2x + y + 2z = 6$ in the first octant. (Nagpur University, Summer 2000)

Solution. A vector normal to the surface "S" is given by

$$\nabla(2x + y + 2z) = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (2x + y + 2z) = 2\hat{i} + \hat{j} + 2\hat{k}$$

And \hat{n} = a unit vector normal to surface S

$$= \frac{2\hat{i} + \hat{j} + 2\hat{k}}{\sqrt{4+1+4}} = \frac{2}{3}\hat{i} + \frac{1}{3}\hat{j} + \frac{2}{3}\hat{k}$$

$$\hat{k} \cdot \hat{n} = \hat{k} \cdot \left(\frac{2}{3}\hat{i} + \frac{1}{3}\hat{j} + \frac{2}{3}\hat{k} \right) = \frac{2}{3}$$

$$\therefore \iint_S \vec{A} \cdot \hat{n} ds = \iint_R \vec{A} \cdot \hat{n} \frac{dx dy}{\hat{k} \cdot \bar{n}}$$

Where R is the projection of S .

$$\text{Now, } \vec{A} \cdot \hat{n} = [(x + y^2) \hat{i} - 2x \hat{j} + 2yz \hat{k}] \cdot \left(\frac{2}{3}\hat{i} + \frac{1}{3}\hat{j} + \frac{2}{3}\hat{k} \right) \\ = \frac{2}{3}(x + y^2) - \frac{2}{3}x + \frac{4}{3}yz = \frac{2}{3}y^2 + \frac{4}{3}yz \quad \dots(1)$$

Putting the value of z in (1), we get

$$\vec{A} \cdot \hat{n} = \frac{2}{3}y^2 + \frac{4}{3}y \left(\frac{6-2x-y}{2} \right) \left(\begin{array}{l} \text{as on the plane } 2x + y + 2z = 6, \\ z = \frac{(6-2x-y)}{2} \end{array} \right) \\ \vec{A} \cdot \hat{n} = \frac{2}{3}y(y+6-2x-y) = \frac{4}{3}y(3-x) \quad \dots(2)$$

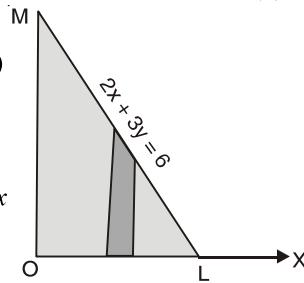

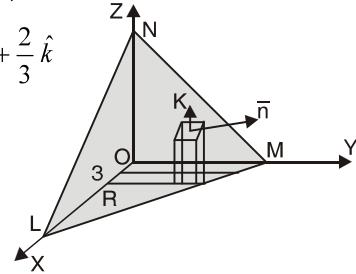

Hence,

$$\iint_S \vec{A} \cdot \hat{n} ds = \iint_R \vec{A} \cdot \bar{n} \frac{dx dy}{|\hat{k} \cdot \bar{n}|} \quad \dots(3)$$

Putting the value of $\vec{A} \cdot \hat{n}$ from (2) in (3), we get

$$\iint_S \vec{A} \cdot \hat{n} ds = \iint_R \frac{4}{3}y(3-x) \cdot \frac{3}{2} dx dy = \int_0^3 \int_0^{6-2x} 2y(3-x) dy dx \\ = \int_0^3 2(3-x) \left[\frac{y^2}{2} \right]_0^{6-2x} dx \\ = \int_0^3 (3-x)(6-2x)^2 dx = 4 \int_0^3 (3-x)^3 dx \\ = 4 \cdot \left[\frac{(3-x)^4}{4(-1)} \right]_0^3 = -(0-81) = 81 \quad \text{Ans.}$$

Example 71. Compute $\int_c \vec{F} \cdot \vec{dr}$, where $\vec{F} = \frac{\hat{i}y - \hat{j}x}{x^2 + y^2}$ and c is the circle $x^2 + y^2 = 1$ traversed counter clockwise.

Solution. $\vec{r} = \hat{i}x + \hat{j}y + \hat{k}z, d\vec{r} = \hat{i}dx + \hat{j}dy + \hat{k}dz$

$$\begin{aligned}\int_C \vec{F} \cdot d\vec{r} &= \int_C \frac{\hat{i}y - \hat{j}x}{x^2 + y^2} \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\ &= \int_C \frac{ydx - xdy}{x^2 + y^2} = \int_C (ydx - xdy) \quad \dots(1) [\because x^2 + y^2 = 1]\end{aligned}$$

Parametric equation of the circle are $x = \cos \theta, y = \sin \theta$.

Putting $x = \cos \theta, y = \sin \theta, dx = -\sin \theta d\theta, dy = \cos \theta d\theta$ in (1), we get

$$\begin{aligned}\int_C \vec{F} \cdot d\vec{r} &= \int_0^{2\pi} \sin \theta (-\sin \theta d\theta) - \cos \theta (\cos \theta d\theta) \\ &= - \int_0^{2\pi} (\sin^2 \theta + \cos^2 \theta) d\theta = - \int_0^{2\pi} d\theta = -(\theta)_0^{2\pi} = -2\pi \quad \text{Ans.}\end{aligned}$$

Example 72. Show that the vector field $\vec{F} = 2x(y^2 + z^3)\hat{i} + 2x^2y\hat{j} + 3x^2z^2\hat{k}$ is conservative. Find its scalar potential and the work done in moving a particle from $(-1, 2, 1)$ to $(2, 3, 4)$.
(A.M.I.E.T.E. June 2010, 2009)

Solution. Here, we have

$$\begin{aligned}\vec{F} &= 2x(y^2 + z^3)\hat{i} + 2x^2y\hat{j} + 3x^2z^2\hat{k} \\ \text{Curl } \vec{F} &= \nabla \times \vec{F} \\ &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2x(y^2 + z^3) & 2x^2y & 3x^2z^2 \end{vmatrix} = (0 - 0)\hat{i} - (6xz^2 - 6xz^2)\hat{j} + (4xy - 4xy)\hat{k} = 0\end{aligned}$$

Hence, vector field \vec{F} is irrotational.

To find the scalar potential function ϕ

$$\begin{aligned}\vec{F} &= \nabla \phi \\ d\phi &= \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz = \left(\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\ &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \phi \cdot \left(d\vec{r} \right) = \nabla \phi \cdot d\vec{r} = \vec{F} \cdot d\vec{r} \\ &= [2x(y^2 + z^3)\hat{i} + 2x^2y\hat{j} + 3x^2z^2\hat{k}] \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\ &= 2x(y^2 + z^3)dx + 2x^2ydy + 3x^2z^2dz \\ \phi &= \int [2x(y^2 + z^3)dx + 2x^2ydy + 3x^2z^2dz] + C\end{aligned}$$

$$\int (2xy^2dx + 2x^2ydy) + (2xz^3dx + 3x^2z^2dz) + C = x^2y^2 + x^2z^3 + C$$

Hence, the scalar potential is $x^2y^2 + x^2z^3 + C$

Now, for conservative field

$$\begin{aligned}\text{Work done} &= \int_C \vec{F} \cdot d\vec{r} = \int_{(-1, 2, 1)}^{(2, 3, 4)} d\phi = [\phi]_{(-1, 2, 1)}^{(2, 3, 4)} = [x^2y^2 + x^2z^3 + c]_{(-1, 2, 1)}^{(2, 3, 4)} \\ &= (36 + 256) - (2 - 1) = 291 \quad \text{Ans.}\end{aligned}$$

Example 73. A vector field is given by $\vec{F} = (\sin y) \hat{i} + x(1 + \cos y) \hat{j}$. Evaluate the line integral over a circular path $x^2 + y^2 = a^2$, $z = 0$. (Nagpur University, Winter 2001)

Solution. We have,

$$\begin{aligned} \text{Work done} &= \int_C \vec{F} \cdot d\vec{r} \\ &= \int_C [(\sin y) \hat{i} + x(1 + \cos y) \hat{j}] \cdot [dx\hat{i} + dy\hat{j}] \quad (\because z = 0 \text{ hence } dz = 0) \\ \Rightarrow \int_C \vec{F} \cdot d\vec{r} &= \int_C \sin y \, dx + x(1 + \cos y) \, dy = \int_C (\sin y \, dx + x \cos y \, dy + x \, dy) \\ &= \int_C d(x \sin y) + \int_C x \, dy \end{aligned}$$

(where d is differential operator).

The parametric equations of given path

$$x^2 + y^2 = a^2 \text{ are } x = a \cos \theta, y = a \sin \theta,$$

Where θ varies from 0 to 2π

$$\begin{aligned} \therefore \int_C \vec{F} \cdot d\vec{r} &= \int_0^{2\pi} d[a \cos \theta \sin(a \sin \theta)] + \int_0^{2\pi} a \cos \theta \cdot a \cos \theta \, d\theta \\ &= \int_0^{2\pi} d[a \cos \theta \sin(a \sin \theta)] + \int_0^{2\pi} a^2 \cos^2 \theta \, d\theta \\ &= [a \cos \theta \sin(a \sin \theta)]_0^{2\pi} + \int_0^{2\pi} a^2 \cos^2 \theta \, d\theta \\ &= 0 + a^2 \int_0^{2\pi} \left(\frac{1 + \cos 2\theta}{2} \right) d\theta = \frac{a^2}{2} \left[\theta + \frac{\sin 2\theta}{2} \right]_0^{2\pi} \\ &= \frac{a^2}{2} \cdot 2\pi = \pi a^2 \end{aligned} \quad \text{Ans.}$$

Example 74. Determine whether the line integral

$\int_C (2xyz^2) \, dx + (x^2z^2 + z \cos yz) \, dy + (2x^2yz + y \cos yz) \, dz$ is independent of the path of

integration? If so, then evaluate it from $(1, 0, 1)$ to $\left(0, \frac{\pi}{2}, 1\right)$.

Solution. $\int_C (2xyz^2) \, dx + (x^2z^2 + z \cos yz) \, dy + (2x^2yz + y \cos yz) \, dz$

$$\begin{aligned} &= \int_C [(2xyz^2)\hat{i} + (x^2z^2 + z \cos yz)\hat{j} + (2x^2yz + y \cos yz)\hat{k}] \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\ &= \int_C \vec{F} \cdot d\vec{r} \end{aligned}$$

This integral is independent of path of integration if

$$\begin{aligned} \vec{F} &= \nabla \phi \Rightarrow \nabla \times \vec{F} = 0 \\ \nabla \times \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2xyz^2 & x^2z^2 + z \cos yz & 2x^2yz + y \cos yz \end{vmatrix} \\ &= (2x^2z + \cos yz - yz \sin yz - 2x^2z - \cos yz + yz \sin yz) \hat{i} - (4xyz - 4x \cos yz)\hat{j} + (2xz^2 - 2xz^2)\hat{k} \\ &= 0 \end{aligned}$$

Hence, the line integral is independent of path.

$$d\phi = \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz \quad (\text{Total differentiation})$$

$$\begin{aligned}
& \left(\hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \right) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \nabla \phi \cdot dr = \vec{F} \cdot \vec{dr} \\
& = [(2xyz^2) \hat{i} + (x^2z^2 + z \cos yz) \hat{j} + (2x^2yz + y \cos yz) \hat{k}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\
& = 2xyz^2 dx + (x^2z^2 + z \cos yz) dy + (2x^2yz + y \cos yz) dz \\
& = [(2x dx) yz^2 + x^2(dy) z^2 + x^2y (2z dz)] + [(\cos yz dy) z + (\cos yz dz) y] \\
& = d(x^2yz^2) + d(\sin yz) \\
\phi & = \int d(x^2yz^2) + \int d(\sin yz) = x^2yz^2 + \sin yz \\
[\phi]_A^B & = \phi(B) - \phi(A) \\
& = [x^2yz^2 + \sin yz]_{(0, \frac{\pi}{2}, 1)} - [x^2yz^2 + \sin yz]_{(1, 0, 1)} = \left[0 + \sin\left(\frac{\pi}{2} \times 1\right) \right] - [0 + 0] \\
& = 1 \quad \text{Ans.}
\end{aligned}$$

Example 75. Evaluate $\iint_S \vec{A} \cdot \hat{n} dS$, where $\vec{A} = 18z\hat{i} - 12\hat{j} + 3y\hat{k}$ and S is the part of the plane $2x + 3y + 6z = 12$ included in the first octant. (Uttarakhand, I semester, Dec. 2006)

Solution. Here, $\vec{A} = 18z\hat{i} - 12\hat{j} + 3y\hat{k}$
Given surface $f(x, y, z) = 2x + 3y + 6z - 12$

$$\text{Normal vector} = \nabla f = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (2x + 3y + 6z - 12) = 2\hat{i} + 3\hat{j} + 6\hat{k}$$

\hat{n} = unit normal vector at any point (x, y, z) of $2x + 3y + 6z = 12$

$$= \frac{2\hat{i} + 3\hat{j} + 6\hat{k}}{\sqrt{4+9+36}} = \frac{1}{7}(2\hat{i} + 3\hat{j} + 6\hat{k})$$

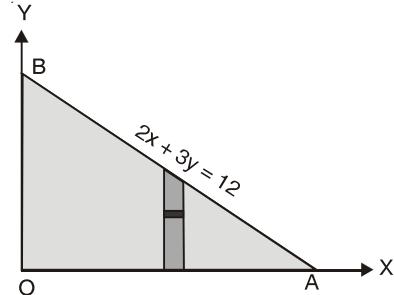

$$dS = \frac{dx dy}{\hat{n} \cdot \hat{k}} = \frac{dx dy}{\frac{1}{7}(2\hat{i} + 3\hat{j} + 6\hat{k}) \cdot \hat{k}} = \frac{dx dy}{\frac{6}{7}} = \frac{7}{6} dx dy$$

$$\text{Now, } \iint \vec{A} \cdot \hat{n} dS = \iint (18z\hat{i} - 12\hat{j} + 3y\hat{k}) \cdot \frac{1}{7}(2\hat{i} + 3\hat{j} + 6\hat{k}) \frac{7}{6} dx dy$$

$$= \iint (36z - 36 + 18y) \frac{dx dy}{6} = \iint (6z - 6 + 3y) dx dy$$

Putting the value of $6z = 12 - 2x - 3y$, we get

$$\begin{aligned}
& = \int_0^6 \int_0^{\frac{1}{3}(12-2x)} (12 - 2x - 3y - 6 + 3y) dx dy \\
& = \int_0^6 \int_0^{\frac{1}{3}(12-2x)} (6 - 2x) dx dy \\
& = \int_0^6 (6 - 2x) dx \int_0^{\frac{1}{3}(12-2x)} dy \\
& = \int_0^6 (6 - 2x) dx (y) \Big|_0^{\frac{1}{3}(12-2x)} \\
& = \int_0^6 (6 - 2x) \frac{1}{3} (12 - 2x) dx = \frac{1}{3} \int_0^6 (4x^2 - 36x + 72) dx \\
& = \frac{1}{3} \left[\frac{4x^3}{3} - 18x^2 + 72x \right]_0^6 = \frac{1}{3} [4 \times 36 \times 2 - 18 \times 36 + 72 \times 6] = \frac{72}{3} [4 - 9 + 6] = 24 \quad \text{Ans.}
\end{aligned}$$

EXERCISE 5.10

- Find the work done by a force $y\hat{i} + x\hat{j}$ which displaces a particle from origin to a point $(\hat{i} + \hat{j})$. **Ans.** 1
- Find the work done when a force $\vec{F} = (x^2 - y^2 + x)\hat{i} - (2xy + y)\hat{j}$ moves a particle from origin to $(1, 1)$ along a parabola $y^2 = x$. **Ans.** $\frac{2}{3}$
- Show that $\vec{V} = (2xy + z^3)\hat{i} + x^2\hat{j} + 3xz^2\hat{k}$ is a conservative field. Find its scalar potential ϕ such that $\vec{V} = \text{grad } \phi$. Find the work done by the force \vec{V} in moving a particle from $(1, -2, 1)$ to $(3, 1, 4)$. **Ans.** $x^2y + xz^3$, 202
- Show that the line integral $\int_C (2xy + 3)dx + (x^2 - 4z)dy - 4ydz$ where c is any path joining $(0, 0, 0)$ to $(1, -1, 3)$ does not depend on the path c and evaluate the line integral. **Ans.** 14
- Find the work done in moving a particle once round the ellipse $\frac{x^2}{25} + \frac{y^2}{16} = 1$, $z = 0$, under the field of force given by $\vec{F} = (2x - y + z)\hat{i} + (x + y - z^2)\hat{j} + (3x - 2y + 4z)\hat{k}$. Is the field of force conservative? (A.M.I.E.T.E., Winter 2000) **Ans.** 40π
- If $\vec{\nabla}\phi = (y^2 - 2xyz^3)\hat{i} + (3 + 2xy - x^2z^3)\hat{j} + (z^3 - 3x^2yz^2)\hat{k}$, find ϕ . **Ans.** $3y + \frac{z^4}{4} + xy^2 - x^2yz^3$
- $\int_C \vec{R} \cdot d\vec{R}$ is independent of the path joining any two point if it is. (A.M.I.E.T.E., June 2010) **Ans.** (i)
(i) irrotational field (ii) solenoidal field (iii) rotational field (iv) vector field.

5.34 SURFACE INTEGRAL

A surface $r = f(u, v)$ is called smooth if f (u, v) posses continuous first order partial derivative.

Let \vec{F} be a vector function and S be the given surface.

Surface integral of a vector function \vec{F} over the surface S is defined

as the integral of the components of \vec{F} along the normal to the surface.

Component of \vec{F} along the normal

$$= \vec{F} \cdot \hat{n}, \text{ where } n \text{ is the unit normal vector to an element } ds \text{ and}$$

$$\hat{n} = \frac{\text{grad } f}{|\text{grad } f|} \quad ds = \frac{dx dy}{(\hat{n} \cdot \hat{k})}$$

Surface integral of F over S

$$= \sum \vec{F} \cdot \hat{n} \quad = \iint_S (\vec{F} \cdot \hat{n}) ds$$

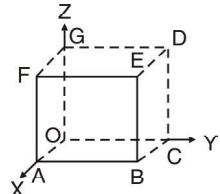

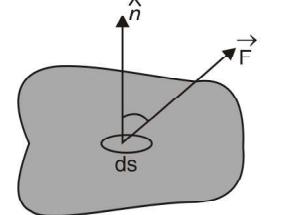

Note. (1) Flux = $\iint_S (\vec{F} \cdot \hat{n}) ds$ where, \vec{F} represents the velocity of a liquid.

If $\iint_S (\vec{F} \cdot \hat{n}) ds = 0$, then \vec{F} is said to be a *solenoidal* vector point function.

Example 76. Evaluate $\iint_S (yz\hat{i} + zx\hat{j} + xy\hat{k}) \cdot d\vec{s}$ where S is the surface of the sphere

$$x^2 + y^2 + z^2 = a^2 \text{ in the first octant.} \quad (\text{U.P., I Semester, Dec. 2004})$$

Solution. Here, $\phi = x^2 + y^2 + z^2 - a^2$

$$\begin{aligned}
 \text{Vector normal to the surface} &= \nabla \phi = \hat{i} \frac{\partial \phi}{\partial x} + \hat{j} \frac{\partial \phi}{\partial y} + \hat{k} \frac{\partial \phi}{\partial z} \\
 &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - a^2) = 2x\hat{i} + 2y\hat{j} + 2z\hat{k} \\
 \hat{n} &= \frac{\nabla \phi}{|\nabla \phi|} = \frac{2x\hat{i} + 2y\hat{j} + 2z\hat{k}}{\sqrt{4x^2 + 4y^2 + 4z^2}} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{\sqrt{x^2 + y^2 + z^2}} \\
 &= \frac{x\hat{i} + y\hat{j} + z\hat{k}}{a} \quad [\because x^2 + y^2 + z^2 = a^2]
 \end{aligned}$$

Here,

$$\vec{F} = yz\hat{i} + zx\hat{j} + xy\hat{k}$$

$$\vec{F} \cdot \hat{n} = (yz\hat{i} + zx\hat{j} + xy\hat{k}) \cdot \left(\frac{x\hat{i} + y\hat{j} + z\hat{k}}{a} \right) = \frac{3xyz}{a}$$

$$\begin{aligned}
 \text{Now, } \iint_S \vec{F} \cdot \hat{n} \, ds &= \iint_S (\vec{F} \cdot \hat{n}) \frac{dx \, dy}{|\hat{k} \cdot \hat{n}|} = \int_0^a \int_0^{\sqrt{a^2 - x^2}} \frac{3xyz \, dx \, dy}{a \left(\frac{z}{a} \right)} \\
 &= 3 \int_0^a \int_0^{\sqrt{a^2 - x^2}} xy \, dy \, dx = 3 \int_0^a x \left(\frac{y^2}{2} \right) \Big|_0^{\sqrt{a^2 - x^2}} \, dx \\
 &= \frac{3}{2} \int_0^a x (a^2 - x^2) \, dx = \frac{3}{2} \left(\frac{a^2 x^2}{2} - \frac{x^4}{4} \right) \Big|_0^a = \frac{3}{2} \left(\frac{a^4}{2} - \frac{a^4}{4} \right) = \frac{3a^4}{8}. \quad \text{Ans.}
 \end{aligned}$$

Example 77. Show that $\iint_S \vec{F} \cdot \hat{n} \, ds = \frac{3}{2}$, where $\vec{F} = 4xz\hat{i} - y^2\hat{j} + yz\hat{k}$

and S is the surface of the cube bounded by the planes,

$$x=0, x=1, y=0, y=1, z=0, z=1.$$

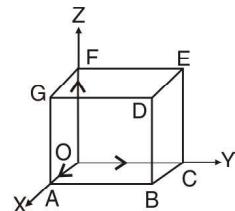

$$\begin{aligned}
 \text{Solution. } \iint_S \vec{F} \cdot \hat{n} \, ds &= \iint_{OABC} \vec{F} \cdot \hat{n} \, ds \\
 &+ \iint_{DEFG} \vec{F} \cdot \hat{n} \, ds + \iint_{OAGF} \vec{F} \cdot \hat{n} \, ds \\
 &+ \iint_{BCED} \vec{F} \cdot \hat{n} \, ds + \iint_{ABDG} \vec{F} \cdot \hat{n} \, ds \\
 &+ \iint_{OCEF} \vec{F} \cdot \hat{n} \, ds \quad \dots(1)
 \end{aligned}$$

| S.No. | Surface | Outward normal | ds | |
|-------|---------|----------------|------------|-------|
| 1 | OABC | $-k$ | $dx \, dy$ | $z=0$ |
| 2 | DEFG | k | $dx \, dy$ | $z=1$ |
| 3 | OAGF | $-j$ | $dx \, dz$ | $y=0$ |
| 4 | BCED | j | $dx \, dz$ | $y=1$ |
| 5 | ABDG | i | $dy \, dz$ | $x=1$ |
| 6 | OCEF | $-i$ | $dy \, dz$ | $x=0$ |

$$\text{Now, } \iint_{OABC} \vec{F} \cdot \hat{n} \, ds = \iint_{OABC} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot (-k) \, dx \, dy = \int_0^1 \int_0^1 -yz \, dx \, dy = 0 \text{ (as } z=0\text{)}$$

$$\begin{aligned}
 \iint_{DEFG} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot \hat{k} \, dx \, dy \\
 &= \iint_{DEFG} yz \, dx \, dy = \int_0^1 \int_0^1 y \, (1) \, dx \, dy \\
 &= \int_0^1 dx \left[\frac{y^2}{2} \right]_0^1 = [x]_0^1 \frac{1}{2} = \frac{1}{2}
 \end{aligned}$$

$$\iint_{OAGF} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot (-j) \, dx \, dz = \iint_{OAGF} y^2 \, dx \, dz = 0 \quad (\text{as } y=0)$$

$$\begin{aligned}\iint_{BCED} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot \hat{j} \, dx \, dz &= \iint_{BCED} (-y^2) \, dx \, dz \\ &= - \int_0^1 dx \int_0^1 dz = -(x)_0^1 (z)_0^1 = -1\end{aligned}\quad (\text{as } y = 1)$$

$$\begin{aligned}\iint_{ABDG} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot \hat{i} \, dy \, dz &= \iint 4xz \, dy \, dz = \int_0^1 \int_0^1 4(1)z \, dy \, dz \\ &= 4(y)_0^1 \left(\frac{z^2}{2} \right)_0^1 = 4(1) \left(\frac{1}{2} \right) = 2\end{aligned}$$

$$\iint_{OCEF} (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot (-\hat{i}) \, dy \, dz = \int_0^1 \int_0^1 -4xz \, dy \, dz = 0 \quad (\text{as } x = 0)$$

On putting these values in (1), we get

$$\iint_S \vec{F} \cdot \hat{n} \, ds = 0 + \frac{1}{2} + 0 - 1 + 2 + 0 = \frac{3}{2} \quad \text{Proved.}$$

EXERCISE 5.11

- Evaluate $\iint_S \vec{A} \cdot \hat{n} \, ds$, where $\vec{A} = (x+y^2)\hat{i} - 2x\hat{j} + 2yz\hat{k}$ and S is the surface of the plane $2x + y + 2z = 6$ in the first octant. **Ans. 81**
- Evaluate $\iint_S \vec{A} \cdot \hat{n} \, ds$, where $\vec{A} = z\hat{i} + x\hat{j} - 3y^2z\hat{k}$ and S is the surface of the cylinder $x^2 + y^2 = 16$ included in the first octant between $z = 0$ and $z = 5$. **Ans. 90**
- If $\vec{r} = t\hat{i} - t^2\hat{j} + (t-1)\hat{k}$ and $\vec{S} = 2t^2\hat{i} + 6t\hat{k}$, evaluate $\int_0^2 \vec{r} \cdot \vec{S} \, dt$. **Ans. 12**
- Evaluate $\iint_S \vec{F} \cdot \hat{n} \, dS$, where, $\vec{F} = 18z\hat{i} - 12\hat{j} + 3y\hat{k}$ and S is the surface of the plane $2x + 3y + 6z = 12$ in the first octant. **Ans. 24**
- Evaluate $\iint_S \vec{F} \cdot \hat{n} \, ds$, where, $F = 2yx\hat{i} - yz\hat{j} + x^2\hat{k}$ over the surface S of the cube bounded by the coordinate planes and planes $x = a$, $y = a$ and $z = a$. **Ans. $\frac{1}{2}a^4$**
- If $\vec{F} = 2y\hat{i} - 3\hat{j} + x^2\hat{k}$ and S is the surface of the parabolic cylinder $y^2 = 8x$ in the first octant bounded by the planes $y = 4$, and $z = 6$, then evaluate $\iint_S \vec{F} \cdot \hat{n} \, dS$. **Ans. 132**

5.35 VOLUME INTEGRAL

Let \vec{F} be a vector point function and volume V enclosed by a closed surface.

The volume integral = $\iiint_V \vec{F} \, dv$

Example 78. If $\vec{F} = 2z\hat{i} - x\hat{j} + y\hat{k}$, evaluate $\iiint_V \vec{F} \, dv$ where, V is the region bounded by the surfaces

$$x = 0, \quad y = 0, \quad x = 2, \quad y = 4, \quad z = x^2, \quad z = 2.$$

Solution. $\iiint_V \vec{F} \, dv = \iiint (2z\hat{i} - x\hat{j} + y\hat{k}) \, dx \, dy \, dz$

$$\begin{aligned}&= \int_0^2 dx \int_0^4 dy \int_{x^2}^2 (2z\hat{i} - x\hat{j} + y\hat{k}) \, dz = \int_0^2 dx \int_0^4 dy [z^2\hat{i} - xz\hat{j} + yz\hat{k}]_{x^2}^2 \\ &= \int_0^2 dx \int_0^4 dy [4\hat{i} - 2x\hat{j} + 2y\hat{k} - x^4\hat{i} + x^3\hat{j} - x^2y\hat{k}]\end{aligned}$$

$$\begin{aligned}
&= \int_0^2 dx \left[4y\hat{i} - 2xy\hat{j} + y^2\hat{k} - x^4y\hat{i} + x^3y\hat{j} - \frac{x^2y^2}{2}\hat{k} \right]_0^4 \\
&= \int_0^2 (16\hat{i} - 8x\hat{j} + 16\hat{k} - 4x^4\hat{i} + 4x^3\hat{j} - 8x^2\hat{k}) dx \\
&= \left[16x\hat{i} - 4x^2\hat{j} + 16x\hat{k} - \frac{4x^5}{5}\hat{i} + x^4\hat{j} - \frac{8x^3}{3}\hat{k} \right]_0^2 \\
&= 32\hat{i} - 16\hat{j} + 32\hat{k} - \frac{128}{5}\hat{i} + 16\hat{j} - \frac{64}{3}\hat{k} = \frac{32}{5}\hat{i} + \frac{32}{3}\hat{k} = \frac{32}{15}(3\hat{i} + 5\hat{k}) \quad \text{Ans.}
\end{aligned}$$

EXERCISE 5.12

- If $\vec{F} = (2x^2 - 3z)\hat{i} - 2xy\hat{j} - 4x\hat{k}$, then evaluate $\iiint_V \nabla \cdot \vec{F} dV$, where V is bounded by the plane $x = 0, y = 0, z = 0$ and $2x + 2y + z = 4$. Ans. $\frac{8}{3}$
- Evaluate $\iiint_V \phi dV$, where $\phi = 45x^2y$ and V is the closed region bounded by the planes $4x + 2y + z = 8, x = 0, y = 0, z = 0$ Ans. 128
- If $\vec{F} = (2x^2 - 3z)\hat{i} - 2xy\hat{j} - 4x\hat{k}$, then evaluate $\iiint_V \nabla \times \vec{F} dV$, where V is the closed region bounded by the planes $x = 0, y = 0, z = 0$ and $2x + 2y + z = 4$. Ans. $\frac{8}{3}(\hat{j} - \hat{k})$
- Evaluate $\iiint_V (2x + y) dV$, where V is closed region bounded by the cylinder $z = 4 - x^2$ and the planes $x = 0, y = 0, y = 2$ and $z = 0$. Ans. $\frac{80}{3}$
- If $\vec{F} = 2xz\hat{i} - x\hat{j} + y^2\hat{k}$, evaluate $\iiint \vec{F} dV$ over the region bounded by the surfaces $x = 0, y = 0, y = 6$ and $z = x^2, z = 4$. Ans. $(16\hat{i} - 3\hat{j} + 48\hat{k})$

5.36 GREEN'S THEOREM (For a plane)

Statement. If $\phi(x, y), \psi(x, y)$, $\frac{\partial\phi}{\partial y}$ and $\frac{\partial\psi}{\partial x}$ be continuous functions over a region R bounded by simple closed curve C in $x-y$ plane, then

$$\oint_C (\phi dx + \psi dy) = \iint_R \left(\frac{\partial\psi}{\partial x} - \frac{\partial\phi}{\partial y} \right) dx dy \quad (\text{AMIETE, June 2010, U.P., ISemester, Dec. 2007})$$

Proof. Let the curve C be divided into two curves C_1 (ABC) and C_2 (CDA).

Let the equation of the curve C_1 (ABC) be $y = y_1(x)$ and equation of the curve C_2 (CDA) be $y = y_2(x)$.

Let us see the value of

$$\begin{aligned}
\iint_R \frac{\partial\phi}{\partial y} dx dy &= \int_{x=a}^{x=c} \left[\int_{y=y_1(x)}^{y=y_2(x)} \frac{\partial\phi}{\partial y} dy \right] dx = \int_a^c [\phi(x, y)]_{y=y_1(x)}^{y=y_2(x)} dx \\
&= \int_a^c [\phi(x, y_2) - \phi(x, y_1)] dx = - \int_c^a \phi(x, y_2) dx - \int_a^c \phi(x, y_1) dx \\
&= - \left[\int_c^a \phi(x, y_2) dx + \int_a^c \phi(x, y_1) dx \right] \\
&= - \left[\int_{C_2} \phi(x, y) dx + \int_{C_1} \phi(x, y) dx \right] = - \oint_C \phi(x, y) dx
\end{aligned}$$

$$\text{Thus, } \oint_c \phi \, dx = - \iint_R \frac{\partial \phi}{\partial y} \, dx \, dy \quad \dots(1)$$

Similarly, it can be shown that

$$\oint_c \psi \, dy = \iint_R \frac{\partial \psi}{\partial x} \, dx \, dy \quad \dots(2)$$

On adding (1) and (2), we get

$$\oint_c (\phi \, dx + \psi \, dy) = \iint_R \left(\frac{\partial \psi}{\partial x} - \frac{\partial \phi}{\partial y} \right) dx \, dy \quad \text{Proved.}$$

Note. Green's Theorem in vector form

$$\int_c \vec{F} \cdot d\vec{r} = \iint_R (\nabla \times \vec{F}) \cdot \hat{k} \, dR$$

where, $\vec{F} = \phi \hat{i} + \psi \hat{j}$, $\vec{r} = x\hat{i} + y\hat{j}$, \hat{k} is a unit vector along z -axis and $dR = dx \, dy$.

Example 79. A vector field \vec{F} is given by $\vec{F} = \sin y \hat{i} + x(1 + \cos y) \hat{j}$.

Evaluate the line integral $\int_C \vec{F} \cdot d\vec{r}$ where C is the circular path given by $x^2 + y^2 = a^2$.

Solution. $\vec{F} = \sin y \hat{i} + x(1 + \cos y) \hat{j}$

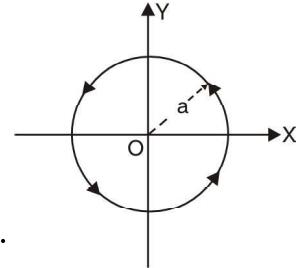

$$\int_C \vec{F} \cdot d\vec{r} = \int_C [\sin y \hat{i} + x(1 + \cos y) \hat{j}] \cdot (\hat{i} dx + \hat{j} dy) = \int_C \sin y \, dx + x(1 + \cos y) \, dy$$

On applying Green's Theorem, we have

$$\begin{aligned} \oint_c (\phi \, dx + \psi \, dy) &= \iint_s \left(\frac{\partial \psi}{\partial x} - \frac{\partial \phi}{\partial y} \right) dx \, dy \\ &= \iint_s [(1 + \cos y) - \cos y] dx \, dy \end{aligned}$$

where s is the circular plane surface of radius a .

$$= \iint_s dx \, dy = \text{Area of circle} = \pi a^2. \quad \text{Ans.}$$

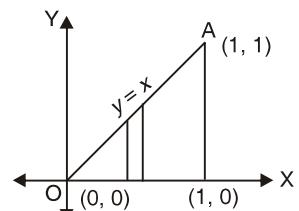

Example 80. Using Green's Theorem, evaluate $\int_c (x^2 y \, dx + x^2 \, dy)$, where C is the boundary described counter clockwise of the triangle with vertices $(0, 0)$, $(1, 0)$, $(1, 1)$.

(U.P., I Semester, Winter 2003)

Solution. By Green's Theorem, we have

$$\begin{aligned} \int_c (\phi \, dx + \psi \, dy) &= \iint_R \left(\frac{\partial \psi}{\partial x} - \frac{\partial \phi}{\partial y} \right) dx \, dy \\ \int_c (x^2 y \, dx + x^2 \, dy) &= \iint_R (2x - x^2) \, dx \, dy \\ &= \int_0^1 (2x - x^2) \, dx \int_0^x dy = \int_0^1 (2x - x^2) \, dx [y]_0^x \\ &= \int_0^1 (2x - x^2) (x) \, dx = \int_0^1 (2x^2 - x^3) \, dx = \left(\frac{2x^3}{3} - \frac{x^4}{4} \right)_0^1 \\ &= \left(\frac{2}{3} - \frac{1}{4} \right) = \frac{5}{12} \quad \text{Ans.} \end{aligned}$$

Example 81. State and verify Green's Theorem in the plane for $\int (3x^2 - 8y^2) \, dx + (4y - 6xy) \, dy$ where C is the boundary of the region bounded by $x \geq 0$, $y \leq 0$ and $2x - 3y = 6$.

(Uttarakhand, I Semester, Dec. 2006)

Solution. Statement: See Article 24.4 on page 576.

Here the closed curve C consists of straight lines OB , BA and AO , where coordinates of A and B are $(3, 0)$ and $(0, -2)$ respectively. Let R be the region bounded by C .

Then by Green's Theorem in plane, we have

$$\begin{aligned} & \oint_C [(3x^2 - 8y^2) dx + (4y - 6xy) dy] \\ &= \iint_R \left[\frac{\partial}{\partial x} (4y - 6xy) - \frac{\partial}{\partial y} (3x^2 - 8y^2) \right] dx dy \quad \dots(1) \\ &= \iint_R (-6y + 16y) dx dy = \iint_R 10y dx dy \end{aligned}$$

$$\begin{aligned} &= 10 \int_0^3 dx \int_{\frac{1}{3}(2x-6)}^0 y dy = 10 \int_0^3 dx \left[\frac{y^2}{2} \right]_{\frac{1}{3}(2x-6)}^0 = -\frac{5}{9} \int_0^3 dx (2x-6)^2 \\ &= -\frac{5}{9} \left[\frac{(2x-6)^3}{3 \times 2} \right]_0^3 = -\frac{5}{54} (0+6)^3 = -\frac{5}{54} (216) = -20 \quad \dots(2) \end{aligned}$$

Now we evaluate L.H.S. of (1) along OB , BA and AO .

Along OB , $x = 0$, $dx = 0$ and y varies from 0 to -2 .

Along BA , $x = \frac{1}{2}(6+3y)$, $dx = \frac{3}{2} dy$ and y varies from -2 to 0.

and along AO , $y = 0$, $dy = 0$ and x varies from 3 to 0.

$$\begin{aligned} \text{L.H.S. of (1)} &= \oint_C [(3x^2 - 8y^2) dx + (4y - 6xy) dy] \\ &= \int_{OB} [(3x^2 - 8y^2) dx + (4y - 6xy) dy] + \int_{BA} [(3x^2 - 8y^2) dx + (4y - 6xy) dy] \\ &\quad + \int_{AO} [(3x^2 - 8y^2) dx + (4y - 6xy) dy] \\ &= \int_0^{-2} 4y dy + \int_{-2}^0 \left[\frac{3}{4}(6+3y)^2 - 8y^2 \right] \left(\frac{3}{2} dy \right) + [4y - 3(6+3y)y] dy + \int_3^0 3x^2 dx \\ &= [2y^2]_{-2}^0 + \int_{-2}^0 \left[\frac{9}{8}(6+3y)^2 - 12y^2 + 4y - 18y - 9y^2 \right] dy + (x^3) \Big|_3^0 \\ &= 2[4] + \int_{-2}^0 \left[\frac{9}{8}(6+3y)^2 - 21y^2 - 14y \right] dy + (0-27) \\ &= 8 + \left[\frac{9}{8} \frac{(6+3y)^3}{3 \times 3} - 7y^3 - 7y^2 \right] \Big|_{-2}^0 - 27 = -19 + \left[\frac{216}{8} + 7(-2)^3 + 7(-2)^2 \right] \\ &= -19 + 27 - 56 + 28 = -20 \quad \dots(3) \end{aligned}$$

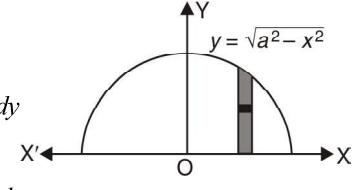

With the help of (2) and (3), we find that (1) is true and so Green's Theorem is verified.

Example 82. Apply Green's Theorem to evaluate $\int_C [(2x^2 - y^2) dx + (x^2 + y^2) dy]$, where C is the boundary of the area enclosed by the x -axis and the upper half of circle $x^2 + y^2 = a^2$.
(M.D.U. Dec. 2009, U.P., I Sem., Dec. 2004)

Solution. $\int_C [(2x^2 - y^2) dx + (x^2 + y^2) dy]$

By Green's Theorem, we've $\int_C (\phi dx + \psi dy) = \iint_S \left(\frac{\partial \psi}{\partial x} - \frac{\partial \phi}{\partial y} \right) dx dy$

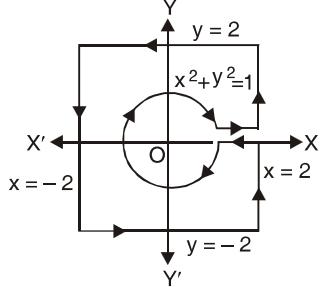

$$\begin{aligned}
&= \int_{-a}^a \int_0^{\sqrt{a^2 - x^2}} \left[\frac{\partial}{\partial x} (x^2 + y^2) - \frac{\partial}{\partial y} (2x^2 - y^2) \right] dx dy \\
&= \int_{-a}^a \int_0^{\sqrt{a^2 - x^2}} (2x + 2y) dx dy = 2 \int_{-a}^a dx \int_0^{\sqrt{a^2 - x^2}} (x + y) dy \\
&= 2 \int_{-a}^a dx \left(xy + \frac{y^2}{2} \right)_0^{\sqrt{a^2 - x^2}} = 2 \int_{-a}^a \left(x\sqrt{a^2 - x^2} + \frac{a^2 - x^2}{2} \right) dx \\
&= 2 \int_{-a}^a x\sqrt{a^2 - x^2} dx + \int_{-a}^a (a^2 - x^2) dx \quad \left[\begin{array}{l} \int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx, f \text{ is even} \\ = 0, \quad f \text{ is odd} \end{array} \right] \\
&= 0 + 2 \int_0^a (a^2 - x^2) dx = 2 \left(a^2 x - \frac{x^3}{3} \right)_0^a = 2 \left(a^3 - \frac{a^3}{3} \right) = \frac{4a^3}{3} \quad \text{Ans.}
\end{aligned}$$

Example 83. Evaluate $\oint_C -\frac{y}{x^2 + y^2} dx + \frac{x}{x^2 + y^2} dy$, where $C = C_1 \cup C_2$ with $C_1 : x^2 + y^2 = 1$ and $C_2 : x = \pm 2, y = \pm 2$. (Gujarat, I Semester, Jan 2009)

Solution. $\oint_C -\frac{y}{x^2 + y^2} dx + \frac{x}{x^2 + y^2} dy$

$$\begin{aligned}
&= \iint \left(\frac{\partial}{\partial x} \frac{x}{x^2 + y^2} + \frac{\partial}{\partial y} \frac{y}{x^2 + y^2} \right) dx dy \\
&= \iint \left[\frac{(x^2 + y^2)1 - 2x(x)}{(x^2 + y^2)^2} + \frac{(x^2 + y^2)1 - 2y(y)}{(x^2 + y^2)^2} \right] dx dy \\
&= \iint \left[\frac{x^2 + y^2 - 2x^2}{(x^2 + y^2)^2} + \frac{x^2 + y^2 - 2y^2}{(x^2 + y^2)^2} \right] dx dy \\
&= \iint \left[\frac{y^2 - x^2}{(x^2 + y^2)^2} + \frac{x^2 - y^2}{(x^2 + y^2)^2} \right] dx dy = \iint \frac{0}{(x^2 + y^2)^2} dx dy = 0 \quad \text{Ans.}
\end{aligned}$$

5.37 AREA OF THE PLANE REGION BY GREEN'S THEOREM

Proof. We know that

$$\int_C M dx + N dy = \iint_A \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y} \right) dx dy \quad \dots(1)$$

On putting $N = x \left(\frac{\partial N}{\partial x} = 1 \right)$ and $M = -y \left(\frac{\partial M}{\partial y} = 1 \right)$ in (1), we get

$$\int_C -y dx + x dy = \iint_A [1 - (-1)] dx dy = 2 \iint_A dx dy = 2 A$$

$$\text{Area} = \frac{1}{2} \int_C (x dy - y dx)$$

Example 84. Using Green's theorem, find the area of the region in the first quadrant bounded by the curves

$$y = x, y = \frac{1}{x}, y = \frac{x}{4}$$

(U.P. I, Semester, Dec. 2008)

Solution. By Green's Theorem Area A of the region bounded by a closed curve C is given by

$$A = \frac{1}{2} \oint_C (xdy - ydx)$$

Here, C consists of the curves $C_1 : y = \frac{x}{4}$, $C_2 : y = \frac{1}{x}$ and $C_3 : y = x$ So

$$\left[A = \frac{1}{2} \oint_C = \frac{1}{2} \left[\int_{C_1} + \int_{C_2} + \int_{C_3} \right] = \frac{1}{2} (I_1 + I_2 + I_3) \right]$$

Along $C_1 : y = \frac{x}{4}$, $dy = \frac{1}{4} dx$, $x : 0$ to 2

$$I_1 = \int_{C_1} (xdy - ydx) = \int_{C_1} \left(x \frac{1}{4} dx - \frac{x}{4} dx \right) = 0$$

Along $C_2 : y = \frac{1}{x}$, $dy = -\frac{1}{x^2} dx$, $x : 2$ to 1

$$I_2 = \int_{C_2} (xdy - ydx) = \int_2^1 \left[x \left(-\frac{1}{x^2} \right) dx - \frac{1}{2} dx \right] = [-2 \log x]_2^1 = 2 \log 2$$

Along $C_3 : y = x$, $dy = dx$; $x : 1$ to 0;

$$I_3 = \int_{C_3} (xdy - ydx) = \int (xdx - xdx) = 0$$

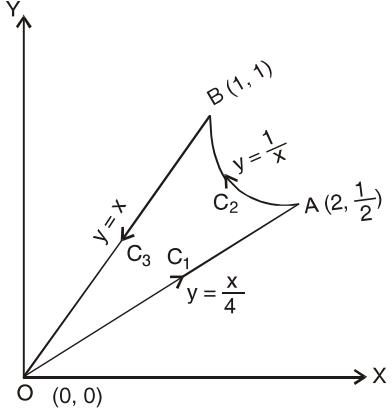

$$A = \frac{1}{2} (I_1 + I_2 + I_3) = \frac{1}{2} (0 + 2 \log 2 + 0) = \log 2$$

Ans.

EXERCISE 5.13

- Evaluate $\int_c [(3x^2 - 6yz) dx + (2y + 3xz) dy + (1 - 4xyz^2) dz]$ from $(0, 0, 0)$ to $(1, 1, 1)$ along the path c given by the straight line from $(0, 0, 0)$ to $(0, 0, 1)$ then to $(0, 1, 1)$ and then to $(1, 1, 1)$.
- Verify Green's Theorem in plane for $\int_C (x^2 + 2xy) dx + (y^2 + x^3y) dy$, where c is a square with the vertices $P(0, 0)$, $Q(1, 0)$, $R(1, 1)$ and $S(0, 1)$. **Ans.** $-\frac{1}{2}$
- Verify Green's Theorem for $\int_c (x^2 - 2xy) dx + (x^2y + 3) dy$ around the boundary c of the region $y^2 = 8x$ and $x = 2$.
- Use Green's Theorem in a plane to evaluate the integral $\int_c [(2x^2 - y^2) dx + (x^2 + y^2) dy]$, where c is the boundary in the xy -plane of the area enclosed by the x -axis and the semi-circle $x^2 + y^2 = 1$ in the upper half xy -plane. **Ans.** $\frac{4}{3}$
- Apply Green's Theorem to evaluate $\int_c [(y - \sin x) dy + \cos x dx]$, where c is the plane triangle enclosed by the lines $y = 0$, $x = \frac{\pi}{2}$ and $y = \frac{2x}{\pi}$. **Ans.** $-\frac{\pi^2 + 8}{4\pi}$
- Either directly or by Green's Theorem, evaluate the line integral $\int_c e^{-x} (\cos y dx - \sin y dy)$, where c is the rectangle with vertices $(0, 0)$, $(\pi, 0)$, $\left(\pi, \frac{\pi}{2}\right)$ and $\left(0, \frac{\pi}{2}\right)$. **Ans.** $2(1 - e^{-\pi})$
(AMIETE II Sem June 2010)
- Verify the Green's Theorem to evaluate the line integral $\int_c (2y^2 dx + 3x dy)$, where c is the boundary of the closed region bounded by $y = x$ and $y = x^2$.

(U.P., I Semester, Dec. 20005, AMIETE Summer 2004, Winter 2001) **Ans.** $\frac{27}{4}$

8. Evaluate $\iint_S \vec{F} \cdot \hat{n} ds$, where $\vec{F} = xy\hat{i} - x^2\hat{j} + (x+z)\hat{k}$ and s is the region of the plane $2x + 2y + z = 6$ in the first octant. *(A.M.I.E.T.E., Summer 2004, Winter 2001) Ans. $\frac{27}{4}$*
9. Verify Green's Theorem for $\int_C [(xy + y^2) dx + x^2 dy]$ where C is the boundary by $y = x$ and $y = x^2$. *(AMIETE, June 2010)*

5.38 STOKE'S THEOREM (Relation between Line Integral and Surface Integral)

(Uttarakhand, I Sem. 2008, U.P., Ist Semester, Dec. 2006)

Statement. Surface integral of the component of $\operatorname{curl} \vec{F}$ along the normal to the surface S , taken over the surface S bounded by curve C is equal to the line integral of the vector point function \vec{F} taken along the closed curve C .

Mathematically

$$\oint_c \vec{F} \cdot d\vec{r} = \iint_S \operatorname{curl} \vec{F} \cdot \hat{n} ds$$

where $\hat{n} = \cos \alpha \hat{i} + \cos \beta \hat{j} + \cos \gamma \hat{k}$ is a unit external normal to any surface ds ,

Proof. Let

$$\begin{aligned} \vec{r} &= x\hat{i} + y\hat{j} + z\hat{k} \\ d\vec{r} &= \hat{i} dx + \hat{j} dy + \hat{k} dz \\ \vec{F} &= F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k} \end{aligned}$$

On putting the values of \vec{F} , $d\vec{r}$ in the statement of the theorem

$$\begin{aligned} &\oint_c (F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) \\ &= \iint_S \left(i \frac{\partial}{\partial x} + j \frac{\partial}{\partial y} + k \frac{\partial}{\partial z} \right) \times (F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}) \cdot (\cos \alpha \hat{i} + \cos \beta \hat{j} + \cos \gamma \hat{k}) ds \\ &\oint_c (F_1 dx + F_2 dy + F_3 dz) = \iint_S \left[\left(\frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z} \right) \hat{i} + \left(\frac{\partial F_1}{\partial z} - \frac{\partial F_3}{\partial x} \right) \hat{j} + \left(\frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) \hat{k} \right] \cdot (\hat{i} \cos \alpha + \hat{j} \cos \beta + \hat{k} \cos \gamma) ds \\ &= \iint_S \left[\left(\frac{\partial F_3}{\partial y} - \frac{\partial F_2}{\partial z} \right) \cos \alpha + \left(\frac{\partial F_1}{\partial z} - \frac{\partial F_3}{\partial x} \right) \cos \beta + \left(\frac{\partial F_2}{\partial x} - \frac{\partial F_1}{\partial y} \right) \cos \gamma \right] ds \quad \dots(1) \end{aligned}$$

Let us first prove

$$\oint_c F_1 dx = \iint_S \left[\left(\frac{\partial F_1}{\partial z} \cos \beta - \frac{\partial F_1}{\partial y} \cos \gamma \right) \right] ds \quad \dots(2)$$

Let the equation of the surface S be $z = g(x, y)$. The projection of the surface on $x - y$ plane is region R .

$$\begin{aligned} \oint_c F_1 (x, y, z) dx &= \oint_c F_1 [x, y, g(x, y)] dx \\ &= - \iint_R \frac{\partial}{\partial y} F_1 (x, y, g) dx dy \quad [\text{By Green's Theorem}] \\ &= - \iint_R \left(\frac{\partial F_1}{\partial y} + \frac{\partial F_1}{\partial z} \frac{\partial g}{\partial y} \right) dx dy \quad \dots(3) \end{aligned}$$

The direction cosines of the normal to the surface $z = g(x, y)$ are given by

$$\frac{\cos \alpha}{\frac{\partial g}{\partial x}} = \frac{\cos \beta}{\frac{\partial g}{\partial y}} = \frac{\cos \gamma}{1}$$

And $dx dy$ = projection of ds on the xy -plane = $ds \cos \gamma$
 Putting the values of ds in R.H.S. of (2)

$$\begin{aligned} \iint_S \left(\frac{\partial F_1}{\partial z} \cos \beta - \frac{\partial F_1}{\partial y} \cos \gamma \right) ds &= \iint_R \left(\frac{\partial F_1}{\partial z} \cos \beta - \frac{\partial F_1}{\partial y} \cos \gamma \right) \frac{dx dy}{\cos \gamma} \\ &= \iint_R \left(\frac{\partial F_1}{\partial z} \frac{\cos \beta}{\cos \gamma} - \frac{\partial F_1}{\partial y} \right) dx dy = \iint_R \left(\frac{\partial F_1}{\partial z} \left(-\frac{\partial g}{\partial y} \right) - \frac{\partial F_1}{\partial y} \right) dx dy \\ &= - \iint_R \left(\frac{\partial F_1}{\partial y} + \frac{\partial F_1}{\partial z} \frac{\partial g}{\partial y} \right) dx dy \end{aligned} \quad \dots(4)$$

From (3) and (4), we get

$$\oint_c F_1 dx = \iint_S \left(\frac{\partial F_1}{\partial z} \cos \beta - \frac{\partial F_1}{\partial y} \cos \gamma \right) ds \quad \dots(5)$$

$$\text{Similarly, } \oint_c F_2 dy = \iint_S \left(\frac{\partial F_2}{\partial x} \cos \gamma - \frac{\partial F_2}{\partial z} \cos \alpha \right) ds \quad \dots(6)$$

$$\text{and } \oint_c F_3 dz = \iint_S \left(\frac{\partial F_3}{\partial y} \cos \alpha - \frac{\partial F_3}{\partial x} \cos \beta \right) ds \quad \dots(7)$$

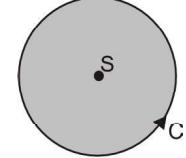

On adding (5), (6) and (7), we get

$$\begin{aligned} \oint_c (F_1 dx + F_2 dy + F_3 dz) &= \iint_S \left(\frac{\partial F_1}{\partial z} \cos \beta - \frac{\partial F_1}{\partial y} \cos \gamma + \frac{\partial F_2}{\partial x} \cos \gamma - \frac{\partial F_2}{\partial z} \cos \alpha \right. \\ &\quad \left. + \frac{\partial F_3}{\partial y} \cos \alpha - \frac{\partial F_3}{\partial x} \cos \beta \right) ds \quad \text{Proved.} \end{aligned}$$

5.39 ANOTHER METHOD OF PROVING STOKE'S THEOREM

The circulation of vector F around a closed curve C is equal to the flux of the curve of the vector through the surface S bounded by the curve C .

$$\oint_c \vec{F} \cdot d\vec{r} = \iint_S \text{curl } \vec{F} \cdot \hat{n} d\vec{S} = \iint_S \text{curl } \vec{F} \cdot d\vec{S}$$

Proof : The projection of any curved surface over xy -plane can be treated as kernal of the surface integral over actual surface

$$\begin{aligned} \text{Now, } \iint_S (\nabla \times \vec{F}) \cdot \hat{k} d\vec{S} &= \iint_S (\nabla \times \vec{F}) \cdot (\hat{i} \times \hat{j}) dx dy \quad [\hat{k} = \hat{i} \times \hat{j}] \\ &= \iint_S [(\nabla \cdot \hat{i})(\vec{F} \cdot \hat{j}) - (\nabla \cdot \hat{j})(\vec{F} \cdot \hat{i})] dx dy = \iint_S \left[\frac{\partial}{\partial x} (F_y) - \frac{\partial}{\partial y} (F_x) \right] dx dy \\ &= \iint_S [F_x dx + F_y dy] \quad [\text{By Green's theorem}] \\ &= \iint_S [\hat{i} F_x + \hat{j} F_y] \cdot (\hat{i} dx + \hat{j} dy) = \oint_c \vec{F} \cdot d\vec{r} \\ \iint_S \text{curl } \vec{F} \cdot \hat{n} dS &= \oint_c \vec{F} \cdot d\vec{r}. \end{aligned}$$

where, $\vec{F} = F_x \hat{i} + F_y \hat{j} + F_z \hat{k}$ and $d\vec{r} = dx \hat{i} + dy \hat{j} + dz \hat{k}$

Example 85. Evaluate by Strokes theorem $\oint_C (yz dx + zx dy + xy dz)$ where C is the curve $x^2 + y^2 = 1$, $z = y^2$. (M.D.U., Dec 2009)

Solution. Here we have $\oint_C yz dx + zx dy + xy dz$

$$= \int (yz\hat{i} + zx\hat{j} + xy\hat{k}) \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz)$$

$$\begin{aligned}
 &= \oint F \cdot d\mathbf{x} \quad \text{Curl } \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ yz & zx & xy \end{vmatrix} \\
 &= \int \text{curl } F \cdot \hat{n} \, ds \quad = (x - x) \hat{i} + (y - y) \hat{j} + (z - z) \hat{k} \\
 &= 0 = 0 \quad \text{Ans.}
 \end{aligned}$$

Example 86. Using Stoke's theorem or otherwise, evaluate

$$\int_c [(2x - y) dx - yz^2 dy - y^2 z dz]$$

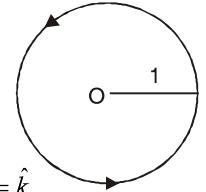

where c is the circle $x^2 + y^2 = 1$, corresponding to the surface of sphere of unit radius.
(U.P., I Semester, Winter 2001)

Solution. $\int_c [(2x - y) dx - yz^2 dy - y^2 z dz]$

$$= \int_c [(2x - y) \hat{i} - yz^2 \hat{j} - y^2 z \hat{k}] \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz)$$

By Stoke's theorem $\oint \vec{F} \cdot d\vec{r} = \iint_S \text{curl } \vec{F} \cdot \hat{n} \, ds$... (1)

$$\begin{aligned}
 \text{Curl } \vec{F} &= \nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2x - y & -yz^2 & -y^2 z \end{vmatrix} \\
 &= (-2yz + 2yz) \hat{i} - (0 - 0) \hat{j} + (0 + 1) \hat{k} = \hat{k}
 \end{aligned}$$

Putting the value of $\text{curl } \vec{F}$ in (1), we get

$$= \iint \hat{k} \cdot \hat{n} \, ds = \iint \hat{k} \cdot \hat{n} \frac{dx \, dy}{\hat{n} \cdot \hat{k}} = \iint dx \, dy = \text{Area of the circle} = \pi \quad \left[\because ds = \frac{dx \, dy}{(\hat{n} \cdot \hat{k})} \right]$$

Example 87. Evaluate $\oint_C \vec{F} \cdot d\vec{r}$, where $F(x, y, z) = -y^2 \hat{i} + x \hat{j} + z^2 \hat{k}$ and C is the curve of intersection of the plane $y + z = 2$ and the cylinder $x^2 + y^2 = 1$. (Gujarat, I sem. Jan. 2009)

Solution. $\oint_C \vec{F} \cdot d\vec{r} = \iint_S \text{curl } \vec{F} \cdot \hat{n} \, ds = \iint_S \text{curl} (-y^2 \hat{i} + x \hat{j} + z^2 \hat{k}) \cdot \hat{n} \, ds$... (1)

$$\begin{aligned}
 F(x, y, z) &= -y^2 \hat{i} + x \hat{j} + z^2 \hat{k} \quad (\text{By Stoke's Theorem}) \\
 \text{Curl } \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ -y^2 & x & z^2 \end{vmatrix} \\
 &= \hat{i} (0 - 0) - \hat{j} (0 - 0) + \hat{k} (1 + 2y) = (1 + 2y) \hat{k}
 \end{aligned}$$

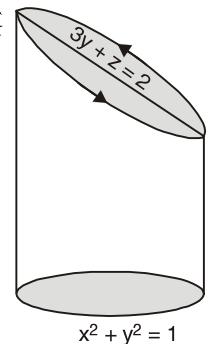

Normal vector $= \nabla \vec{F}$

$$= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (y + z - 2) = \hat{j} + \hat{k}$$

Unit normal vector \hat{n}

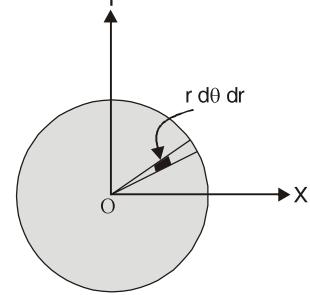

$$= \frac{\hat{j} + \hat{k}}{\sqrt{2}}$$

$$ds = \frac{dx \, dy}{\hat{n} \cdot \hat{k}}$$

On putting the values of $\text{curl } \vec{F}$, \hat{n} and ds in (1), we get

$$\begin{aligned}
 \int_C \vec{F} \cdot d\vec{r} &= \iint_S (1+2y) \hat{k} \cdot \frac{\hat{j} + \hat{k}}{\sqrt{2}} \frac{dx dy}{\left(\frac{\hat{j} + \hat{k}}{\sqrt{2}} \right) \cdot \hat{k}} \\
 &= \iint_S \frac{1+2y}{\sqrt{2}} \frac{dx dy}{\frac{1}{\sqrt{2}}} = \iint_S (1+2y) dx dy = \int_0^{2\pi} \int_0^1 (1+2r \sin \theta) r d\theta dr \\
 &= \int_0^{2\pi} \int_0^1 (r + 2r^2 \sin \theta) d\theta dr \\
 &= \int_0^{2\pi} d\theta \left[\frac{r^2}{2} + \frac{2r^3}{3} \sin \theta \right]_0^1 = \int_0^{2\pi} \left[\frac{1}{2} + \frac{2}{3} \sin \theta \right] d\theta \\
 &= \left[\frac{\theta}{2} - \frac{2}{3} \cos \theta \right]_0^{2\pi} = \left(\pi - \frac{2}{3} - 0 + \frac{2}{3} \right) = \pi \quad \text{Ans.}
 \end{aligned}$$

Example 88. Apply Stoke's Theorem to find the value of

$$\int_c (y dx + z dy + x dz)$$

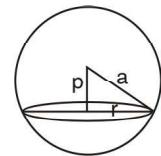

where c is the curve of intersection of $x^2 + y^2 + z^2 = a^2$ and $x + z = a$. (Nagpur, Summer 2001)

Solution. $\int_c (y dx + z dy + x dz)$

$$\begin{aligned}
 &= \int_c (y\hat{i} + z\hat{j} + x\hat{k}) \cdot (\hat{i} dx + \hat{j} dy + \hat{k} dz) = \int_C (y\hat{i} + z\hat{j} + x\hat{k}) \cdot d\vec{r} \\
 &= \iint_S \text{curl} (y\hat{i} + z\hat{j} + x\hat{k}) \cdot \hat{n} ds \quad (\text{By Stoke's Theorem}) \\
 &= \iint_S \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times (y\hat{i} + z\hat{j} + x\hat{k}) \cdot \hat{n} ds = \iint_S -(\hat{i} + \hat{j} + \hat{k}) \cdot \hat{n} ds \quad \dots(1)
 \end{aligned}$$

where S is the circle formed by the intersection of $x^2 + y^2 + z^2 = a^2$ and $x + z = a$.

$$\begin{aligned}
 \hat{n} &= \frac{\nabla \phi}{|\nabla \phi|} = \frac{\left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x + z - a)}{|\nabla \phi|} = \frac{\hat{i} + \hat{k}}{\sqrt{1+1}} \\
 \therefore \hat{n} &= \frac{\hat{i}}{\sqrt{2}} + \frac{\hat{k}}{\sqrt{2}}
 \end{aligned}$$

Putting the value of \hat{n} in (1), we have

$$\begin{aligned}
 &= \iint_S -(\hat{i} + \hat{j} + \hat{k}) \cdot \left(\frac{\hat{i}}{\sqrt{2}} + \frac{\hat{k}}{\sqrt{2}} \right) ds \\
 &= \iint_S -\left(\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} \right) ds \quad \left[\text{Use } r^2 = R^2 - p^2 = a^2 - \frac{a^2}{2} = \frac{a^2}{2} \right] \\
 &= \frac{-2}{\sqrt{2}} \iint_S ds = \frac{-2}{\sqrt{2}} \pi \left(\frac{a}{\sqrt{2}} \right)^2 = -\frac{\pi a^2}{\sqrt{2}} \quad \text{Ans.}
 \end{aligned}$$

Example 89. Directly or by Stoke's Theorem, evaluate $\iint_S \text{curl } \vec{v} \cdot \hat{n} ds$, $\vec{v} = \hat{i}y + \hat{j}z + \hat{k}x$, s is the surface of the paraboloid $z = 1 - x^2 - y^2$, $z^3 \geq 0$ and \hat{n} is the unit vector normal to s .

Solution. $\nabla \times \vec{v} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y & z & x \end{vmatrix} = -\hat{i} - \hat{j} - \hat{k}$

Obviously $\hat{n} = \hat{k}$.

Therefore $(\nabla \times \vec{v}) \cdot \hat{n} = (-\hat{i} - \hat{j} - \hat{k}) \cdot \hat{k} = -1$

Hence $\iint_S (\nabla \times \vec{v}) \cdot \hat{n} \, ds = \iint_S (-1) \, dx \, dy = - \iint_S dx \, dy = -\pi (1)^2 = -\pi$ (Area of circle = πr^2) **Ans.**

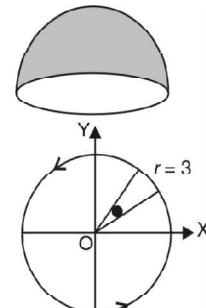

Example 90. Use Stoke's Theorem to evaluate $\int_c \vec{v} \cdot d\vec{r}$, where $\vec{v} = y^2 \hat{i} + xy \hat{j} + xz \hat{k}$, and c is the bounding curve of the hemisphere $x^2 + y^2 + z^2 = 9$, $z > 0$, oriented in the positive direction.

Solution. By Stoke's theorem

$$\begin{aligned} \int_c \vec{v} \cdot d\vec{r} &= \iint_S (\text{curl } \vec{v}) \cdot \hat{n} \, ds = \iint_S (\nabla \times \vec{v}) \cdot \hat{n} \, ds \\ \nabla \times \vec{v} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 & xy & xz \end{vmatrix} = (0 - 0) \hat{i} - (z - 0) \hat{j} + (y - 2y) \hat{k} \\ \hat{n} &= \frac{\nabla \phi}{|\nabla \phi|} = \frac{\left(i \frac{\partial}{\partial x} + j \frac{\partial}{\partial y} + k \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 9)}{|\nabla \phi|} \\ &= \frac{2x \hat{i} + 2y \hat{j} + 2z \hat{k}}{\sqrt{4x^2 + 4y^2 + 4z^2}} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{\sqrt{x^2 + y^2 + z^2}} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{3} \\ (\nabla \times \vec{v}) \cdot \hat{n} &= (-z \hat{j} - y \hat{k}) \cdot \frac{x \hat{i} + y \hat{j} + z \hat{k}}{3} = \frac{-yz - yz}{3} = \frac{-2yz}{3} \\ \hat{n} \cdot \hat{k} \, ds &= dx \, dy \Rightarrow \frac{x \hat{i} + y \hat{j} + z \hat{k}}{3} \cdot \hat{k} \, dx = dx \, dy \Rightarrow \frac{z}{3} \, ds = dx \, dy \end{aligned}$$

∴

$$\begin{aligned} \iint_S (\nabla \times \vec{v}) \cdot \hat{n} \, ds &= \iint_S \left(\frac{-2yz}{3} \right) \left(\frac{3}{z} \, dx \, dy \right) = - \iint_S 2y \, dx \, dy \\ &= - \iint_0^{2\pi} \int_0^3 2r \sin \theta \, r \, d\theta \, dr = -2 \int_0^{2\pi} \sin \theta \, d\theta \int_0^3 r^2 \, dr \\ &= -2 (-\cos \theta) \Big|_0^{2\pi} \cdot \left[\frac{r^3}{3} \right]_0^3 = -2 (-1 + 1) 9 = 0 \quad \text{Ans.} \end{aligned}$$

Example 91. Evaluate the surface integral $\iint_S \text{curl } \vec{F} \cdot \hat{n} \, dS$ by transforming it into a line integral, S being that part of the surface of the paraboloid $z = 1 - x^2 - y^2$ for which $z \geq 0$ and $\vec{F} = y \hat{i} + z \hat{j} + x \hat{k}$. (K. University, Dec. 2008)

Solution. $\vec{\nabla} \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y & z & x \end{vmatrix} = -\hat{i} - \hat{j} - \hat{k}$

Obviously $\hat{n} = \hat{k}$.

Therefore $(\vec{\nabla} \times \vec{F}) \cdot \hat{n} = (-\hat{i} - \hat{j} - \hat{k}) \cdot \hat{k} = -1$

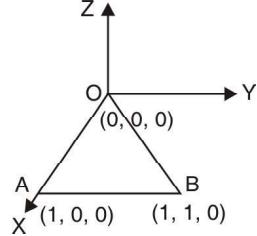

Hence $\iint_S (\vec{\nabla} \times \vec{F}) \cdot \hat{n} \, ds = \iint_S (-1) \, dx \, dy = - \iint_S dx \, dy = -\pi (1)^2 = -\pi$ (Area of circle = πr^2) **Ans.**

Example 92. Evaluate $\oint_C \vec{F} \cdot d\vec{r}$ by Stoke's Theorem, where $\vec{F} = y^2 \hat{i} + x^2 \hat{j} - (x+z) \hat{k}$ and C is the boundary of triangle with vertices at $(0, 0, 0)$, $(1, 0, 0)$ and $(1, 1, 0)$.
(U.P., I Semester, Winter 2000)

Solution. We have, $\text{curl } \vec{F} = \vec{\nabla} \times \vec{F}$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y^2 & x^2 & -(x+z) \end{vmatrix} = 0 \cdot \hat{i} + \hat{j} \cdot 2(x-y) \hat{k}.$$

We observe that z co-ordinate of each vertex of the triangle is zero. Therefore, the triangle lies in the xy -plane.

$$\therefore \hat{n} = \hat{k}$$

$$\therefore \text{curl } \vec{F} \cdot \hat{n} = [\hat{j} + 2(x-y)\hat{k}] \cdot \hat{k} = 2(x-y).$$

In the figure, only xy -plane is considered.

The equation of the line OB is $y = x$

By Stoke's theorem, we have

$$\begin{aligned} \oint_C \vec{F} \cdot d\vec{r} &= \iint_S (\text{curl } \vec{F} \cdot \hat{n}) \, ds \\ &= \int_{x=0}^1 \int_{y=0}^x 2(x-y) \, dx \, dy = 2 \int_0^1 \left[xy - \frac{y^2}{2} \right]_0^x \, dx \\ &= 2 \int_0^1 \left[x^2 - \frac{x^2}{2} \right] \, dx = 2 \int_0^1 \frac{x^2}{2} \, dx = \int_0^1 x^2 \, dx = \left[\frac{x^3}{3} \right]_0^1 = \frac{1}{3}. \end{aligned} \quad \text{Ans.}$$

Example 93. Evaluate $\oint_C \vec{F} \cdot d\vec{r}$ by Stoke's Theorem, where $\vec{F} = (x^2 + y^2) \hat{i} - 2xy \hat{j}$ and C is the boundary of the rectangle $x = \pm a$, $y = 0$ and $y = b$. (U.P., I Semester, Winter 2002)

Solution. Since the z co-ordinate of each vertex of the given rectangle is zero, hence the given rectangle must lie in the xy -plane.

Here, the co-ordinates of A , B , C and D are $(a, 0)$, (a, b) , $(-a, b)$ and $(-a, 0)$ respectively.

$$\therefore \text{Curl } \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 + y^2 & -2xy & 0 \end{vmatrix} = -4y \hat{k}$$

Here, $\hat{n} = \hat{k}$, so by Stoke's theorem, we've

$$\begin{aligned}
 \oint_C \vec{F} \cdot d\vec{r} &= \iint_S \operatorname{curl} \vec{F} \cdot \hat{n} \, dS \\
 &= \iint_S (-4y\hat{k}) \cdot (\hat{k}) \, dx \, dy = -4 \int_{x=-a}^a \int_{y=0}^b y \, dx \, dy \\
 &= -4 \int_{-a}^a \left[\frac{y^2}{2} \right]_0^b \, dx = -2b^2 \int_{-a}^a dx = -4ab^2
 \end{aligned}
 \tag{Ans.}$$

Example 94. Apply Stoke's Theorem to calculate $\int_c 4y \, dx + 2z \, dy + 6y \, dz$ where c is the curve of intersection of $x^2 + y^2 + z^2 = 6z$ and $z = x + 3$.

Solution.

$$\begin{aligned}
 \int_c \vec{F} \cdot d\vec{r} &= \int_c 4y \, dx + 2z \, dy + 6y \, dz \\
 &= \int_c (4y\hat{i} + 2z\hat{j} + 6y\hat{k}) \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz)
 \end{aligned}$$

$$\begin{aligned}
 \vec{F} &= 4y\hat{i} + 2z\hat{j} + 6y\hat{k} \\
 \nabla \times \vec{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 4y & 2z & 6y \end{vmatrix} = (6-2)\hat{i} - (0-0)\hat{j} + (0-4)\hat{k} \\
 &= 4\hat{i} - 4\hat{k}
 \end{aligned}$$

S is the surface of the circle $x^2 + y^2 + z^2 = 6z$, $z = x + 3$, \hat{n} is normal to the plane $x - z + 3 = 0$

$$\begin{aligned}
 \hat{n} &= \frac{\nabla \phi}{|\nabla \phi|} = \frac{\left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x - z + 3)}{|\nabla \phi|} = \frac{\hat{i} - \hat{k}}{\sqrt{1+1}} = \frac{\hat{i} - \hat{k}}{\sqrt{2}} \\
 (\nabla \times F) \cdot \hat{n} &= (4\hat{i} - 4\hat{k}) \cdot \frac{\hat{i} - \hat{k}}{\sqrt{2}} = \frac{4+4}{\sqrt{2}} = 4\sqrt{2}
 \end{aligned}$$

$$\int_c \vec{F} \cdot d\vec{r} = \iint_S (\operatorname{curl} F) \cdot \hat{n} \, dS = \iint_S 4\sqrt{2} \, (dx \, dz) = 4\sqrt{2} \text{ (area of circle)}$$

Centre of the sphere $x^2 + y^2 + (z-3)^2 = 9$, $(0, 0, 3)$ lies on the plane $z = x + 3$. It means that the given circle is a great circle of sphere, where radius of the circle is equal to the radius of the sphere.

$$\text{Radius of circle} = 3, \text{Area} = \pi(3)^2 = 9\pi$$

$$\iint_S (\nabla \times F) \cdot \hat{n} \, dS = 4\sqrt{2}(9\pi) = 36\sqrt{2}\pi
 \tag{Ans.}$$

Example 95. Verify Stoke's Theorem for the function $\vec{F} = z\hat{i} + x\hat{j} + y\hat{k}$, where C is the unit circle in xy -plane bounding the hemisphere $z = \sqrt{1-x^2-y^2}$. (U.P., I Semester Comp. 2002)

Solution. Here

$$\vec{F} = z\hat{i} + x\hat{j} + y\hat{k}. \tag{1}$$

Also,

$$\vec{r} = x\hat{i} + y\hat{j} + z\hat{k} \Rightarrow \vec{dr} = dx\hat{i} + dy\hat{j} + dz\hat{k}.$$

∴

$$\vec{F} \cdot \vec{dr} = z \, dx + x \, dy + y \, dz.$$

$$\therefore \oint_C \vec{F} \cdot \vec{dr} = \oint_C (z \, dx + x \, dy + y \, dz). \tag{2}$$

On the circle C , $x^2 + y^2 = 1$, $z = 0$ on the xy -plane. Hence on C , we have $z = 0$ so that $dz = 0$. Hence (2) reduces to

$$\oint_C \vec{F} \cdot d\vec{r} = \oint_C x \, dy. \quad \dots(3)$$

Now the parametric equations of C , i.e., $x^2 + y^2 = 1$ are

$$x = \cos \phi, \quad y = \sin \phi. \quad \dots(4)$$

$$\text{Using (4), (3) reduces to } \oint_C \vec{F} \cdot d\vec{r} = \int_{\phi=0}^{2\pi} \cos \phi \cos \phi \, d\phi = \int_0^{2\pi} \frac{1 + \cos 2\phi}{2} \, d\phi$$

$$= \frac{1}{2} \left[\phi + \frac{\sin 2\phi}{2} \right]_0^{2\pi} = \pi \quad \dots(5)$$

Let $P(x, y, z)$ be any point on the surface of the hemisphere $x^2 + y^2 + z^2 = 1$, O origin is the centre of the sphere.

$$\text{Radius} = OP = x\hat{i} + y\hat{j} + z\hat{k} \quad \text{Normal} = x\hat{i} + y\hat{j} + z\hat{k}$$

$$\hat{n} = \frac{x\hat{i} + y\hat{j} + z\hat{k}}{\sqrt{x^2 + y^2 + z^2}} = x\hat{i} + y\hat{j} + z\hat{k}$$

(Radius is \perp to tangent i.e. Radius is normal) $\dots(6)$

$$x = \sin \theta \cos \phi, \quad y = \sin \theta \sin \phi, \quad z = \cos \theta$$

$$\hat{n} = \sin \theta \cos \phi \hat{i} + \sin \theta \sin \phi \hat{j} + \cos \theta \hat{k}$$

$$\text{Also, } \text{Curl } \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \partial/\partial x & \partial/\partial y & \partial/\partial z \\ z & x & y \end{vmatrix} = \hat{i} + \hat{j} + \hat{k} \quad \dots(7)$$

$$\begin{aligned} \text{Curl } \vec{F} \cdot \hat{n} &= (\hat{i} + \hat{j} + \hat{k}) \cdot (\sin \theta \cos \phi \hat{i} + \sin \theta \sin \phi \hat{j} + \cos \theta \hat{k}) \\ &= \sin \theta \cos \phi \hat{i} + \sin \theta \sin \phi \hat{j} + \cos \theta \hat{k} \end{aligned}$$

$$\begin{aligned} \therefore \iint_S \text{Curl } \vec{F} \cdot \hat{n} \, dS &= \int_{\theta=0}^{\pi/2} \int_{\phi=0}^{2\pi} (\hat{i} + \hat{j} + \hat{k}) \\ &\quad \cdot (\sin \theta \cos \phi \hat{i} + \sin \theta \sin \phi \hat{j} + \cos \theta \hat{k}) \sin \theta \, d\theta \, d\phi \\ &= \int_{\theta=0}^{\pi/2} \sin \theta \, d\theta \int_{\phi=0}^{2\pi} (\sin \theta \cos \phi + \sin \theta \sin \phi + \cos \theta) \, d\phi \\ & \quad [\because dS = \text{Elementary area on hemisphere} = \sin \theta \, d\theta \, d\phi] \\ &= \int_0^{\pi/2} \sin \theta \, d\theta [\sin \theta \sin \phi + \sin \theta (-\cos \phi) + \phi \cos \theta]_0^{2\pi} = \int_0^{\pi/2} \sin \theta \, d\theta \\ &= \int_0^{\pi/2} (0 + 0 + 2\pi \sin \theta \cos \theta) \, d\theta = \pi \int_0^{\pi/2} \sin 2\theta \, d\theta = \pi \left[-\frac{\cos 2\theta}{2} \right]_0^{\pi/2} \\ &= -(\pi/2) [-1 - 1] = \pi. \end{aligned}$$

From (5) and (8), $\oint_C \vec{F} \cdot d\vec{r} = \iint_S \text{curl } \vec{F} \cdot \hat{n} \, dS$, which verifies Stokes's theorem.

Example 96. Verify Stoke's theorem for the vector field $\vec{F} = (2x - y)\hat{i} - yz^2\hat{j} - y^2z\hat{k}$ over the upper half of the surface $x^2 + y^2 + z^2 = 1$ bounded by its projection on xy -plane.

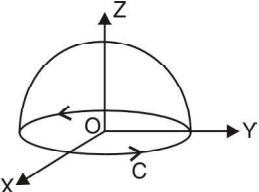

(Nagpur University, Summer 2001)

Solution. Let S be the upper half surface of the sphere $x^2 + y^2 + z^2 = 1$. The boundary C or S is a circle in the xy plane of radius unity and centre O . The equation of C are $x^2 + y^2 = 1$,

$$z = 0 \text{ whose parametric form is}$$

$$x = \cos t, \quad y = \sin t, \quad z = 0, \quad 0 < t < 2\pi$$

$$\oint_C \vec{F} \cdot d\vec{r} = \int_C [(2x - y)\hat{i} - yz^2\hat{j} - y^2z\hat{k}] \cdot [\hat{i} \, dx + \hat{j} \, dy + \hat{k} \, dz]$$

$$\begin{aligned}
&= \int_C [(2x - y) dx - yz^2 dy - y^2 z dz] = \int_C (2x - y) dx, \text{ since on } C, z = 0 \text{ and } 2z = 0 \\
&= \int_0^{2\pi} (2 \cos t - \sin t) \frac{dx}{dt} dt = \int_0^{2\pi} (2 \cos t - \sin t) (-\sin t) dt \\
&= \int_0^{2\pi} (-\sin 2t + \sin^2 t) dt = \int_0^{2\pi} \left(-\sin 2t + \frac{1 - \cos 2t}{2} \right) dt \\
&= \left[\frac{\cos 2t}{2} + \frac{t}{2} - \frac{\sin 2t}{4} \right]_0^{2\pi} = \frac{1}{2} + \pi - \frac{1}{2} = \pi
\end{aligned} \tag{1}$$

$$\text{Curl } \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2x - y & -yz^2 & -y^2 z \end{vmatrix} = (-2yz + 2yz) \hat{i} + (0 - 0) \hat{j} + (0 + 1) \hat{k} = \hat{k}$$

$$\text{Curl } \vec{F} \cdot \hat{n} = \hat{k} \cdot \hat{n} = \hat{n} \cdot \hat{k}$$

$$\iint_S \text{Curl } \vec{F} \cdot \hat{n} ds = \iint_S \hat{n} \cdot \hat{k} ds = \iint_R \hat{n} \cdot \hat{k} \frac{dx}{\hat{n}} \cdot \frac{dy}{\hat{k}}$$

Where R is the projection of S on xy -plane.

$$\begin{aligned}
&= \int_{-1}^1 \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} dx dy = \int_{-1}^1 2\sqrt{1-x^2} dx = 4 \int_0^1 \sqrt{1-x^2} dx \\
&= 4 \left[\frac{x}{2} \sqrt{1-x^2} + \frac{1}{2} \sin^{-1} x \right]_0^1 = 4 \left[\frac{1}{2} \cdot \frac{\pi}{2} \right] = \pi
\end{aligned} \tag{2}$$

From (1) and (2), we have

$$\therefore \int_C \vec{F} \cdot d\vec{r} = \iint_S \text{Curl } \vec{F} \cdot \hat{n} ds \text{ which is the Stoke's theorem.} \quad \text{Ans.}$$

Example 97. Verify Stoke's Theorem for $\vec{F} = (x^2 + y - 4) \hat{i} + 3xy \hat{j} + (2xz + z^2) \hat{k}$ over the surface of hemisphere $x^2 + y^2 + z^2 = 16$ above the xy -plane.

Solution. $\int_c \vec{F} \cdot d\vec{r}$, where c is the boundary of the circle $x^2 + y^2 + z^2 = 16$

(bounding the hemispherical surface)

$$\begin{aligned}
&= \int_c [(x^2 + y - 4) \hat{i} + 3xy \hat{j} + (2xz + z^2) \hat{k}] \cdot (\hat{i} dx + \hat{j} dy) \\
&= \int_c [(x^2 + y - 4) dx + 3xy dy]
\end{aligned}$$

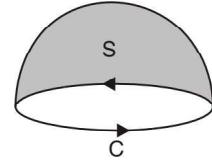

Putting $x = 4 \cos \theta, y = 4 \sin \theta, dx = -4 \sin \theta d\theta, dy = 4 \cos \theta d\theta$

$$\begin{aligned}
&= \int_0^{2\pi} [(16 \cos^2 \theta + 4 \sin \theta - 4) (-4 \sin \theta d\theta) + (192 \sin \theta \cos^2 \theta d\theta)] \\
&= 16 \int_0^{2\pi} [-4 \cos^2 \theta \sin \theta - \sin^2 \theta + \sin \theta + 12 \sin \theta \cos^2 \theta] d\theta
\end{aligned}$$

$$= 16 \int_0^{2\pi} (8 \sin \theta \cos^2 \theta - \sin^2 \theta + \sin \theta) d\theta$$

$$= -16 \int_0^{2\pi} \sin^2 \theta d\theta$$

$$= -16 \times 4 \int_0^{\frac{\pi}{2}} \sin^2 \theta d\theta = -64 \left(\frac{1}{2} \frac{\pi}{2} \right) = -16 \pi. \quad \left\{ \begin{array}{l} \int_0^{2\pi} \sin^n \theta \cos \theta d\theta = 0 \\ \int_0^{2\pi} \cos^n \theta \sin \theta d\theta = 0 \end{array} \right\}$$

$$\text{To evaluate surface integral } \nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 + y - 4 & 3xy & 2xz + z^2 \end{vmatrix}$$

$$\begin{aligned}
&= (0 - 0) \hat{i} - (2z - 0) \hat{j} + (3y - 1) \hat{k} = -2z \hat{j} + (3y - 1) \hat{k} \\
\hat{n} &= \frac{\nabla \phi}{|\nabla \phi|} = \frac{\left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (x^2 + y^2 + z^2 - 16)}{|\nabla \phi|} \\
&= \frac{2x \hat{i} + 2y \hat{j} + 2z \hat{k}}{\sqrt{4x^2 + 4y^2 + 4z^2}} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{\sqrt{x^2 + y^2 + z^2}} = \frac{x \hat{i} + y \hat{j} + z \hat{k}}{4} \\
(\nabla \times \vec{F}) \cdot \hat{n} &= [-2z \hat{j} + (3y - 1) \hat{k}] \cdot \frac{x \hat{i} + y \hat{j} + z \hat{k}}{4} = \frac{-2yz + (3y - 1)z}{4} \\
\hat{k} \cdot \hat{n} \cdot ds &= dx dy \Rightarrow \frac{x \hat{i} + y \hat{j} + z \hat{k}}{4} \cdot k ds = dx dy \Rightarrow \frac{z}{4} ds = dx dy \\
\therefore ds &= \frac{4}{z} dx dy \\
\iint (\nabla \times F) \cdot \hat{n} ds &= \iint \frac{-2yz + (3y - 1)z}{4} \left(\frac{4}{z} dx dy \right) = \iint [-2y + (3y - 1)] dx dy = \iint (y - 1) dx dy
\end{aligned}$$

On putting $x = r \cos \theta$, $y = r \sin \theta$, $dx dy = r d\theta dr$, we get

$$\begin{aligned}
&= \iint (r \sin \theta - 1) r d\theta dr = \int d\theta \int (r^2 \sin \theta - r) dr \\
&= \int_0^{2\pi} d\theta \left(\frac{r^3}{3} \sin \theta - \frac{r^2}{2} \right)_0^{2\pi} = \int_0^{2\pi} d\theta \left(\frac{64}{3} \sin \theta - 8 \right) \\
&= \left(-\frac{64}{3} \cos \theta - 8\theta \right)_0^{2\pi} = \frac{-64}{3} - 16\pi + \frac{64}{3} = -16\pi
\end{aligned}$$

The line integral is equal to the surface integral, hence Stoke's Theorem is verified. **Proved.**

Example 98. Verify Stoke's theorem for a vector field defined by $\vec{F} = (x^2 - y^2) \hat{i} + 2xy \hat{j}$ in the rectangular in xy-plane bounded by lines $x = 0$, $x = a$, $y = 0$, $y = b$.

(Nagpur University, Summer 2000)

Solution. Here we have to verify Stoke's theorem $\int_C \vec{F} \cdot d\vec{r} = \iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds$

Where 'C' be the boundary of rectangle (ABCD) and S be the surface enclosed by curve C.

$$\begin{aligned}
\vec{F} &= (x^2 - y^2) \hat{i} + (2xy) \hat{j} \\
\vec{F} \cdot d\vec{r} &= [(x^2 - y^2) \hat{i} + 2xy \hat{j}] \cdot [\hat{i} dx + \hat{j} dy] \\
\Rightarrow \vec{F} \cdot d\vec{r} &= (x^2 + y^2) dx + 2xy dy \quad \dots(1)
\end{aligned}$$

$$\text{Now, } \int_C \vec{F} \cdot d\vec{r} = \int_{OA} \vec{F} \cdot d\vec{r} + \int_{AB} \vec{F} \cdot d\vec{r} + \int_{BC} \vec{F} \cdot d\vec{r} + \int_{CO} \vec{F} \cdot d\vec{r} \quad \dots(2)$$

Along OA, put $y = 0$ so that $k dy = 0$ in (1) and $\vec{F} \cdot d\vec{r} = x^2 dx$,
Where x is from 0 to a .

$$\therefore \int_{OA} \vec{F} \cdot d\vec{r} = \int_0^a x^2 dx = \left[\frac{x^3}{3} \right]_0^a = \frac{a^3}{3} \quad \dots(3)$$

Along AB, put $x = a$ so that $dx = 0$ in (1), we get $\vec{F} \cdot d\vec{r} = 2ay dy$
Where y is from 0 to b .

$$\therefore \int_{AB} \vec{F} \cdot d\vec{r} = \int_0^b 2ay dy = [ay^2]_0^b = ab^2 \quad \dots(4)$$

Along BC , put $y = b$ and $dy = 0$ in (1) we get $\vec{F} \cdot \vec{dr} = (x^2 - b^2) dx$, where x is from a to 0 .

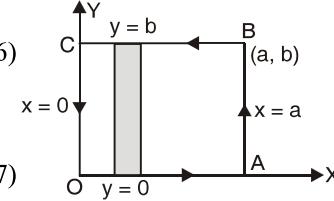

$$\therefore \int_{BC} \vec{F} \cdot \vec{dr} = \int_a^0 (x^2 - b^2) dx = \left[\frac{x^3}{3} - b^2 x \right]_a^0 = \frac{-a^3}{3} + b^2 a \quad \dots(5)$$

Along CO , put $x = 0$ and $dx = 0$ in (1), we get $\vec{F} \cdot \vec{dr} = 0$

$$\therefore \int_{CO} \vec{F} \cdot \vec{dr} = 0 \quad \dots(6)$$

Putting the values of integrals (3), (4), (5) and (6) in (2), we get

$$\int_C \vec{F} \cdot \vec{dr} = \frac{a^3}{3} + ab^2 - \frac{a^3}{3} + ab^2 + 0 = 2ab^2 \quad \dots(7)$$

Now we have to evaluate R.H.S. of Stoke's Theorem i.e. $\iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds$

We have,

$$\nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 - y^2 & 2xy & 0 \end{vmatrix} = (2y + 2y) \hat{k} = 4y \hat{k}$$

Also the unit vector normal to the surface S in outward direction is $\hat{n} = \hat{k}$

($\because z$ -axis is normal to surface S)

Also in xy -plane $ds = dx dy$

$$\therefore \iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds = \iint_R 4y \hat{k} \cdot \hat{k} dx dy = \iint_R 4y dx dy.$$

Where R be the region of the surface S .

Consider a strip parallel to y -axis. This strip starts on line $y = 0$ (i.e. x -axis) and end on the line $y = b$, We move this strip from $x = 0$ (y -axis) to $x = a$ to cover complete region R .

$$\therefore \iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds = \int_0^a \left[\int_0^b 4y dy \right] dx = \int_0^a [2y^2]_0^b dx \\ = \int_0^a 2b^2 dx = 2b^2 [x]_0^a = 2ab^2 \quad \dots(8)$$

\therefore From (7) and (8), we get

$$\int_C \vec{F} \cdot \vec{dr} = \iint_S (\nabla \times \vec{F}) \cdot \hat{n} ds \text{ and hence the Stoke's theorem is verified.}$$

Example 99. Verify Stoke's Theorem for the function

$$\vec{F} = x^2 \hat{i} - xy \hat{j}$$

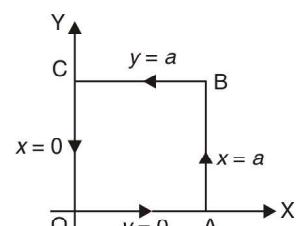

integrated round the square in the plane $z = 0$ and bounded by the lines

$$x = 0, y = 0, x = a, y = a.$$

Solution. We have, $\vec{F} = x^2 \hat{i} - xy \hat{j}$

$$\nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 & -xy & 0 \end{vmatrix}$$

$$= (0 - 0) \hat{i} - (0 - 0) \hat{j} + (-y - 0) \hat{k} = -y \hat{k}$$

($\hat{n} \perp$ to xy plane i.e. \hat{k})

$$\begin{aligned}
 \iint_S (\nabla \times \vec{F}) \cdot \hat{n} \, ds &= \iint_S (-yk) \cdot k \, dx \, dy \\
 &= \int_0^a dx \int_0^a -y \, dy = \int_0^a dx \left[-\frac{y^2}{2} \right]_0^a = -\frac{a^2}{2} (x)_0^a = -\frac{a^3}{2}
 \end{aligned} \quad \dots(1)$$

To obtain line integral

$$\int_C \vec{F} \cdot \vec{dr} = \int_C (x^2 \hat{i} - xy \hat{j}) \cdot (\hat{i} \, dx + \hat{j} \, dy) = \int_C (x^2 \, dx - xy \, dy)$$

where c is the path $OABC$ as shown in the figure.

$$\begin{aligned}
 \text{Also, } \int_C \vec{F} \cdot \vec{dr} &= \int_{OABC} \vec{F} \cdot \vec{dr} = \int_{OA} \vec{F} \cdot \vec{dr} + \int_{AB} \vec{F} \cdot \vec{dr} + \int_{BC} \vec{F} \cdot \vec{dr} + \int_{CO} \vec{F} \cdot \vec{dr} \\
 \text{Along } OA, \, y = 0, \, dy = 0
 \end{aligned} \quad \dots(2)$$

$$\begin{aligned}
 \int_{OA} \vec{F} \cdot \vec{dr} &= \int_{OA} (x^2 \, dx - xy \, dy) \\
 &= \int_0^a x^2 \, dx = \left[\frac{x^3}{3} \right]_0^a = \frac{a^3}{3}
 \end{aligned}$$

Along AB , $x = a$, $dx = 0$

$$\begin{aligned}
 \int_{AB} \vec{F} \cdot \vec{dr} &= \int_{AB} (x^2 \, dx - xy \, dy) \\
 &= \int_0^a -ay \, dy = -a \left[\frac{y^2}{2} \right]_0^a = -\frac{a^3}{2}
 \end{aligned}$$

Along BC , $y = a$, $dy = 0$

$$\int_{BC} \vec{F} \cdot \vec{dr} = \int_{BC} (x^2 \, dx - xy \, dy) = \int_a^0 x^2 \, dx = \left[\frac{x^3}{3} \right]_a^0 = -\frac{a^3}{3}$$

Along CO , $x = 0$, $dx = 0$

$$\int_{CO} \vec{F} \cdot \vec{dr} = \int_{CO} (x^2 \, dx - xy \, dy) = 0$$

Putting the values of these integrals in (2), we have

$$\int_C \vec{F} \cdot \vec{dr} = \frac{a^3}{3} - \frac{a^3}{2} - \frac{a^3}{3} + 0 = -\frac{a^3}{2} \quad \dots(3)$$

$$\text{From (1) and (3), } \iint_S (\nabla \times \vec{F}) \cdot \hat{n} \, ds = \int_C \vec{F} \cdot \vec{dr}$$

Hence, Stoke's Theorem is verified. Ans.

Example 100. Verify Stoke's Theorem for $\vec{F} = (x+y) \hat{i} + (2x-z) \hat{j} + (y+z) \hat{k}$ for the surface of a triangular lamina with vertices $(2, 0, 0)$, $(0, 3, 0)$ and $(0, 0, 6)$.

(Nagpur University 2004, K. U. Dec. 2009, 2008, A.M.I.E.T.E., Summer 2000)

Solution. Here the path of integration c consists of the straight lines AB , BC , CA where the co-ordinates of A , B , C and $(2, 0, 0)$, $(0, 3, 0)$ and $(0, 0, 6)$ respectively. Let S be the plane surface of triangle ABC bounded by C . Let \hat{n} be unit normal vector to surface S . Then by Stoke's Theorem, we must have

$$\oint_c \vec{F} \cdot \vec{dr} = \iint_S \text{curl } \vec{F} \cdot \hat{n} \, ds \quad \dots(1)$$

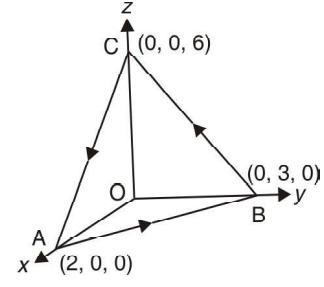

$$\text{L.H.S. of (1)} = \int_{ABC}^c \vec{F} \cdot d\vec{r} = \int_{AB} \vec{F} \cdot d\vec{r} + \int_{BC} \vec{F} \cdot d\vec{r} + \int_{CA} \vec{F} \cdot d\vec{r}$$

Along line AB , $z = 0$, equation of AB is $\frac{x}{2} + \frac{y}{3} = 1$

$$\Rightarrow y = \frac{3}{2}(2-x), dy = -\frac{3}{2}dx$$

At A , $x = 2$, At B , $x = 0$, $\vec{r} = x\hat{i} + y\hat{j}$

$$\begin{aligned} \int_{AB} \vec{F} \cdot d\vec{r} &= \int_{AB} [(x+y)\hat{i} + 2x\hat{j} + y\hat{k}] \cdot (i dx + j dy) \\ &= \int_{AB} (x+y) dx + 2x dy \\ &= \int_{AB} \left(x + 3 - \frac{3x}{2} \right) dx + 2x \left(-\frac{3}{2} dx \right) \\ &= \int_2^0 \left(-\frac{7x}{2} + 3 \right) dx = \left(-\frac{7x^2}{4} + 3x \right)_2^0 \\ &= (7-6) = +1 \end{aligned}$$

| line | Eq. of line | | Lower limit | Upper limit |
|------|--|-----------------------|-------------------|-------------------|
| AB | $\frac{x}{2} + \frac{y}{3} = 1$ $z = 0$ | $dy = -\frac{3}{2}dx$ | At A $x = 2$ | At B $x = 0$ |
| BC | $\frac{y}{3} + \frac{z}{6} = 1$ $x = 0$ | $dz = -2dy$ | At B $y = 3$ | At C $y = 0$ |
| CA | $\frac{x}{2} + \frac{z}{6} = 1$ $y = 0$ | $dz = -3dx$ | At C $x = 0$ | At A $x = 2$ |

Along line BC , $x = 0$, Equation of BC is $\frac{y}{3} + \frac{z}{6} = 1$ or $z = 6 - 2y$, $dz = -2dy$

At B , $y = 3$, At C , $y = 0$, $\vec{r} = y\hat{j} + z\hat{k}$

$$\begin{aligned} \int_{BC} \vec{F} \cdot d\vec{r} &= \int_{BC} [yi + zj + (y+z)k] \cdot (j dy + k dz) = \int_{BC} -z dy + (y+z) dz \\ &= \int_3^0 (-6+2y) dy + (y+6-2y)(-2dy) \\ &= \int_3^0 (4y-18) dy = (2y^2 - 18y)_3^0 = 36 \end{aligned}$$

Along line CA , $y = 0$, Eq. of CA , $\frac{x}{2} + \frac{z}{6} = 1$ or $z = 6 - 3x$, $dz = -3dx$

At C , $x = 0$, at A , $x = 2$, $\vec{r} = x\hat{i} + z\hat{k}$

$$\begin{aligned} \int_{CA} \vec{F} \cdot d\vec{r} &= \int_{CA} [x\hat{i} + (2x-z)\hat{j} + z\hat{k}] \cdot (dx\hat{i} + dz\hat{k}) = \int_{CA} (xdx + zdz) \\ &= \int_0^2 x dx + (6-3x)(-3dx) = \int_0^2 (10x-18) dx = [5x^2 - 18x]_0^2 = -16 \end{aligned}$$

$$\text{L.H.S. of (1)} = \int_{ABC} \vec{F} \cdot d\vec{r} = \int_{AB} \vec{F} \cdot d\vec{r} + \int_{BC} \vec{F} \cdot d\vec{r} + \int_{CA} \vec{F} \cdot d\vec{r} = 1 + 36 - 16 = 21 \quad \dots(2)$$

$$\begin{aligned} \text{Curl } \vec{F} &= \nabla \times \vec{F} = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \times [(x+y) \hat{i} + (2x-z) \hat{j} + (y+z) \hat{k}] \\ &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x+y & 2x-z & y+z \end{vmatrix} = (1+1) \hat{i} - (0-0) \hat{j} + (2-1) \hat{k} = 2\hat{i} + \hat{k} \end{aligned}$$

$$\text{Equation of the plane of ABC is } \frac{x}{2} + \frac{y}{3} + \frac{z}{6} = 1$$

Normal to the plane ABC is

$$\begin{aligned} \nabla \phi &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \left(\frac{x}{2} + \frac{y}{3} + \frac{z}{6} - 1 \right) = \frac{\hat{i}}{2} + \frac{\hat{j}}{3} + \frac{\hat{k}}{6} \\ \text{Unit Normal Vector} &= \frac{\frac{\hat{i}}{2} + \frac{\hat{j}}{3} + \frac{\hat{k}}{6}}{\sqrt{\frac{1}{4} + \frac{1}{9} + \frac{1}{36}}} \\ \hat{n} &= \frac{1}{\sqrt{14}} (3\hat{i} + 2\hat{j} + \hat{k}) \end{aligned}$$

$$\begin{aligned} \text{R.H.S. of (1)} &= \iint_s \text{curl } \vec{F} \cdot \hat{n} \, ds = \iint_s (2\hat{i} + \hat{k}) \cdot \frac{1}{\sqrt{14}} (3\hat{i} + 2\hat{j} + \hat{k}) \frac{dx \, dy}{\sqrt{14}} \\ &= \iint_s \frac{(6+1)}{\sqrt{14}} \frac{dx \, dy}{\frac{1}{\sqrt{14}}} = 7 \iint dx \, dy = 7 \text{ Area of } \Delta \text{ OAB} \\ &= 7 \left(\frac{1}{2} \times 2 \times 3 \right) = 21 \quad \dots(3) \end{aligned}$$

with the help of (2) and (3) we find (1) is true and so Stoke's Theorem is verified.

Example 101. Verify Stoke's Theorem for

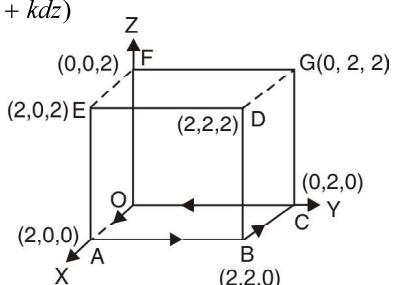

$\vec{F} = (y-z+2) \hat{i} + (yz+4) \hat{j} - (xz) \hat{k}$
over the surface of a cube $x = 0, y = 0, z = 0, x = 2, y = 2, z = 2$ above the XOY plane (open the bottom).

Solution. Consider the surface of the cube as shown in the figure. Bounding path is $OABCO$ shown by arrows.

$$\begin{aligned} \int_c \vec{F} \cdot d\vec{r} &= \int_c [(y-z+2) \hat{i} + (yz+4) \hat{j} - (xz) \hat{k}] \cdot (\hat{i}dx + \hat{j}dy + \hat{k}dz) \\ &= \int_c (y-z+2) \, dx + (yz+4) \, dy - xz \, dz \end{aligned}$$

$$\int_c \vec{F} \cdot d\vec{r} = \int_{OA} \vec{F} \cdot d\vec{r} + \int_{AB} \vec{F} \cdot d\vec{r} + \int_{BC} \vec{F} \cdot d\vec{r} + \int_{CO} \vec{F} \cdot d\vec{r} \quad \dots(1)$$

(1) Along $OA, y = 0, dy = 0, z = 0, dz = 0$

| | Line | Equ. of line | | Lower limit | Upper limit | $\vec{F} \cdot \vec{dr}$ |
|---|------|--------------------|----------------------|----------------|----------------|--------------------------|
| 1 | OA | $y = 0$ $z = 0$ | $dy = 0$ $dz = 0$ | $x = 0$ | $x = 2$ | $2 dx$ |
| 2 | AB | $x = 2$ $z = 0$ | $dx = 0$ $dz = 0$ | $y = 0$ | $y = 2$ | $4 dy$ |
| 3 | BC | $y = 2$ $z = 0$ | $dy = 0$ $dz = 0$ | $x = 2$ | $x = 0$ | $4 dx$ |
| 4 | CO | $x = 0$ $z = 0$ | $dx = 0$ $dz = 0$ | $y = 2$ | $y = 0$ | $4 dy$ |

$$\int_{OA} \vec{F} \cdot \vec{dr} = \int_0^2 2 dx = [2x]_0^2 = 4$$

(2) Along AB , $x = 2$, $dx = 0$, $z = 0$, $dz = 0$

$$\int_{AB} \vec{F} \cdot \vec{dr} = \int_0^2 4 dy = 4(y)_0^2 = 8$$

(3) Along BC , $y = 2$, $dy = 0$, $z = 0$, $dz = 0$

$$\int_{BC} \vec{F} \cdot \vec{dr} = \int_0^2 (2 - 0 + 2) dx = (4x)_0^2 = -8$$

(4) Along CO , $x = 0$, $dx = 0$, $z = 0$, $dz = 0$

$$\int_{CO} \vec{F} \cdot \vec{dr} = \int (y - 0 + 2) \times 0 + (0 + 4) dy = 0$$

$$= 4 \int dy = 4(y)_2^0 = -8$$

On putting the values of these integrals in (1), we get

$$\int_c \vec{F} \cdot \vec{dr} = 4 + 8 - 8 - 8 = -4$$

To obtain surface integral

$$\nabla \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y - z + 2 & yz + 4 & -xz \end{vmatrix}$$

$$= (0 - y) \hat{i} - (-z + 1) \hat{j} + (0 - 1) \hat{k} = -y \hat{i} + (z - 1) \hat{j} - \hat{k}$$

Here we have to integrate over the five surfaces, $ABDE$, $OCGF$, $BCGD$, $OAEF$, $DEFG$.

Over the surface $ABDE$ ($x = 2$), $\hat{n} = i$, $ds = dy dz$

$$\begin{aligned} \iint (\nabla \times \vec{F}) \cdot \hat{n} ds &= \iint [-yi + (z - 1)j - k] \cdot i dx dz = \iint -y dy dz \\ &= \iint_R [F_3(x, y, z)]_{z=f_1(x, y)}^{z=f_2(x, y)} dx dy \end{aligned}$$

| | Surface | Outward normal | ds | |
|---|---------|----------------|---------|---------|
| 1 | $ABDE$ | i | $dy dz$ | $x = 2$ |
| 2 | $OCGF$ | $-i$ | $dy dz$ | $x = 0$ |
| 3 | $BCGD$ | j | $dx dz$ | $y = 2$ |
| 4 | $OAEF$ | $-j$ | $dx dz$ | $y = 0$ |
| 5 | $DEFG$ | k | $dx dy$ | $z = 2$ |

$$= - \int_0^2 y dy \int_0^2 dz = - \left[\frac{y^2}{2} \right]_0^2 [z]_0^2 = -4$$

Over the surface $OCGF$ ($x = 0$), $\hat{n} = -i$, $ds = dy dz$

$$\begin{aligned} \iint (\nabla \times \vec{F}) \cdot \hat{n} ds &= \iint [-y\hat{i} + (z-1)\hat{j} - \hat{k}] \cdot (-\hat{i}) dy dz \\ &= \iint y dy dz = \int_0^2 y dy \int_0^2 dz = 2 \left[\frac{y^2}{2} \right]_0^2 = 4 \end{aligned}$$

(3) Over the surface $BCGD$, ($y = 2$), $\hat{n} = j$, $ds = dx dz$

$$\begin{aligned} \iint (\nabla \times \vec{F}) \cdot \hat{n} ds &= \iint [-y\hat{i} + (z-1)\hat{j} - \hat{k}] \cdot \hat{j} dx dz \\ &= - \iint (z-1) dx dz = - \int_0^2 dx \int_0^2 (z-1) dz = - (x)_0^2 \left(\frac{z^2}{2} - z \right)_0^2 = 0 \end{aligned}$$

(4) Over the surface $OAEF$, ($y = 0$), $\hat{n} = -\hat{j}$, $ds = dx dz$

$$\begin{aligned} \iint (\nabla \times \vec{F}) \cdot \hat{n} ds &= \iint [-y\hat{i} + (z-1)\hat{j} - \hat{k}] \cdot (-\hat{j}) dx dz \\ &= - \iint (z-1) dx dz = - \int_0^2 dx \int_0^2 (z-1) dz = - (x)_0^2 \left(\frac{z^2}{2} - z \right)_0^2 = 0 \end{aligned}$$

(5) Over the surface $DEFG$, ($z = 2$), $\hat{n} = k$, $ds = dx dy$

$$\begin{aligned} \iint (\nabla \times \vec{F}) \cdot \hat{n} ds &= \iint [-y\hat{i} + (z-1)\hat{j} - \hat{k}] \cdot \hat{k} dx dy = - \iint dx dy \\ &= - \int_0^2 dx \int_0^2 dy = - [x]_0^2 [y]_0^2 = -4 \end{aligned}$$

Total surface integral = $-4 + 4 + 0 + 0 - 4 = -4$

$$\text{Thus } \iint_S \text{curl } \vec{F} \cdot \hat{n} ds = \int_C \vec{F} \cdot \vec{dr} = -4$$

which verifies Stoke's Theorem.

Ans.

EXERCISE 5.14

- Use the Stoke's Theorem to evaluate $\int_C y^2 dx + xy dy + xz dz$, where C is the bounding curve of the hemisphere $x^2 + y^2 + z^2 = 1, z \geq 0$, oriented in the positive direction. **Ans. 0**
- Evaluate $\int_S (\text{curl } F) \cdot \hat{n} dA$, using the Stoke's Theorem, where $\vec{F} = y\hat{i} + z\hat{j} + x\hat{k}$ and s is the paraboloid $z = f(x, y) = 1 - x^2 - y^2, z \geq 0$. **Ans. π**
- Evaluate the integral for $\int_C y^2 dx + z^2 dy + x^2 dz$, where C is the triangular closed path joining the points $(0, 0, 0), (0, a, 0)$ and $(0, 0, a)$ by transforming the integral to surface integral using Stoke's Theorem. **Ans. $\frac{a^3}{3}$**
- Verify Stoke's Theorem for $\vec{A} = 3y\hat{i} - xz\hat{j} + yz^2\hat{k}$, where S is the surface of the paraboloid $2z = x^2 + y^2$ bounded by $z = 2$ and C is its boundary traversed in the clockwise direction. **Ans. -20π**
- Evaluate $\int_C \vec{F} \cdot dR$ where $\vec{F} = y\hat{i} + xz^3\hat{j} - zy^3\hat{k}$, C is the circle $x^2 + y^2 = 4, z = 1.5$. **Ans. $\frac{19}{2}\pi$**
- If S is the surface of the sphere $x^2 + y^2 + z^2 = 9$. Prove that $\int_S \text{curl } \vec{F} \cdot dS = 0$.
- Verify Stoke's Theorem for the vector field $\vec{F} = (2y + z)\hat{i} + (x - z)\hat{j} + (y - x)\hat{k}$ over the portion of the plane $x + y + z = 1$ cut off by the co-ordinate planes.
- Evaluate $\int_C \vec{F} \cdot dr$ by Stoke's Theorem for $\vec{F} = yz\hat{i} + zx\hat{j} + xy\hat{k}$ and C is the curve of intersection of $x^2 + y^2 = 1$ and $y = z^2$. **Ans. 0**
- If $\vec{F} = (x - z)\hat{i} + (x^3 + yz)\hat{j} + 3xy^2\hat{k}$ and S is the surface of the cone $z = a - \sqrt{x^2 + y^2}$ above the xy -plane, show that $\iint_S \text{curl } \vec{F} \cdot dS = 3\pi a^4 / 4$.
- If $\vec{F} = 3y\hat{i} - xy\hat{j} + yz2\hat{k}$ and S is the surface of the paraboloid $2z = x^2 + y^2$ bounded by $z = 2$, show by using Stoke's Theorem that $\iint_S (\nabla \times \vec{F}) \cdot dS = 20\pi$.
- If $\vec{F} = (y^2 + z^2 - x^2)\hat{i} + (z^2 + x^2 - y^2)\hat{j} + (x^2 + y^2 - z^2)\hat{k}$, evaluate $\int_S \text{curl } \vec{F} \cdot \hat{n} dS$ integrated over the portion of the surface $x^2 + y^2 - 2ax + az = 0$ above the plane $z = 0$ and verify Stoke's Theorem; where \hat{n} is unit vector normal to the surface. **(A.M.I.E.T.E., Winter 20002) Ans. $2\pi a^3$**
- Evaluate by using Stoke's Theorem $\int_C [\sin z dx - \cos x dy + \sin y dz]$ where C is the boundary of rectangle $0 \leq x \leq \pi, 0 \leq y \leq 1, z = 3$. **(AMIETE, June 2010)**

5.40 GAUSS'S THEOREM OF DIVERGENCE

(Relation between surface integral and volume integral)

(U.P., 1st Semester, Jan., 2011, Dec, 2006)

Statement. The surface integral of the normal component of a vector function F taken around a closed surface S is equal to the integral of the divergence of F taken over the volume V enclosed by the surface S .

Mathematically

$$\iint_S \vec{F} \cdot \hat{n} dS = \iiint_V \text{div } \vec{F} dV$$

Proof. Let $\vec{F} = F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}$.

Putting the values of \vec{F} , \hat{n} in the statement of the divergence theorem, we have

$$\begin{aligned} \iint_S F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k} \cdot \hat{n} \, ds &= \iiint_V \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}) \, dx \, dy \, dz \\ &= \iiint_V \left(\frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z} \right) \, dx \, dy \, dz \end{aligned} \quad \dots(1)$$

We require to prove (1).

Let us first evaluate $\iiint_V \frac{\partial F_3}{\partial z} \, dx \, dy \, dz$.

$$\begin{aligned} \iiint_V \frac{\partial F_3}{\partial z} \, dx \, dy \, dz &= \iint_R \left[\int_{z=f_1(x,y)}^{z=f_2(x,y)} \frac{\partial F_3}{\partial z} \, dz \right] dx \, dy \\ &= \iint_R [F_3(x, y, f_2) - F_3(x, y, f_1)] \, dx \, dy \end{aligned} \quad \dots(2)$$

For the upper part of the surface i.e. S_2 , we have

$$dx \, dy = ds_2 \cos r_2 = \hat{n}_2 \cdot \hat{k} \, ds_2$$

Again for the lower part of the surface i.e. S_1 , we have,

$$dx \, dy = -\cos r_1, \, ds_1 = \hat{n}_1 \cdot \hat{k} \, ds_1$$

$$\iint_R F_3(x, y, f_2) \, dx \, dy = \iint_{S_2} F_3 \hat{n}_2 \cdot \hat{k} \, ds_2$$

$$\text{and } \iint_R F_3(x, y, f_1) \, dx \, dy = - \iint_{S_1} F_3 \hat{n}_1 \cdot \hat{k} \, ds_1$$

Putting these values in (2), we have

$$\iiint_V \frac{\partial F_3}{\partial z} \, dv = \iint_{S_2} F_3 \hat{n}_2 \cdot \hat{k} \, ds_2 + \iint_{S_1} F_3 \hat{n}_1 \cdot \hat{k} \, ds_1 = \iint_S F_3 \hat{n} \cdot \hat{k} \, ds \quad \dots(3)$$

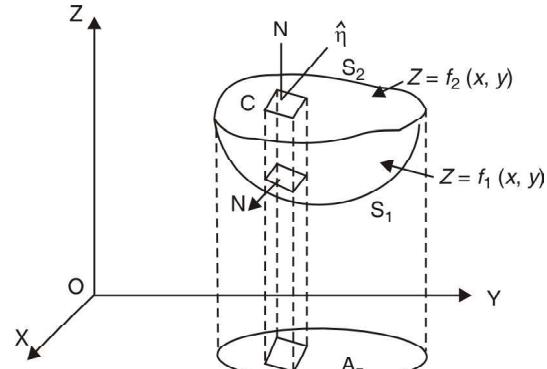

Similarly, it can be shown that

$$\iiint_V \frac{\partial F_2}{\partial y} \, dv = \iint_S F_2 \hat{n} \cdot \hat{j} \, ds \quad \dots(4)$$

$$\iiint_V \frac{\partial F_1}{\partial x} \, dv = \iint_S F_1 \hat{n} \cdot \hat{i} \, ds \quad \dots(5)$$

Adding (3), (4) & (5), we have

$$\begin{aligned} \iiint_V \left(\frac{\partial F_1}{\partial x} + \frac{\partial F_2}{\partial y} + \frac{\partial F_3}{\partial z} \right) \, dv \\ &= \iint_S (F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}) \cdot \hat{n} \, ds \\ \Rightarrow \iiint_V (\nabla \cdot \vec{F}) \, dv &= \iint_S \vec{F} \cdot \hat{n} \, ds \quad \text{Proved.} \end{aligned}$$

Example 102. State Gauss's Divergence theorem $\iint_S \vec{F} \cdot \hat{n} \, ds = \iiint_V \operatorname{Div} \vec{F} \, dv$ where S is the

surface of the sphere $x^2 + y^2 + z^2 = 16$ and $\vec{F} = 3x \hat{i} + 4y \hat{j} + 5z \hat{k}$.

(Nagpur University, Winter 2004)

Solution. Statement of Gauss's Divergence theorem is given in Art 24.8 on page 597. Thus by Gauss's divergence theorem,

$$\iint_S \vec{F} \cdot \hat{n} \, ds = \iint_V \int \nabla \cdot \vec{F} \, dv \quad \text{Here } \vec{F} = 3x \hat{i} + 4y \hat{j} + 5z \hat{k}$$

$$\nabla \cdot \vec{F} = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (3x\hat{i} + 4y\hat{j} + 5z\hat{k})$$

$$\nabla \cdot \vec{F} = 3 + 4 + 5 = 14$$

Putting the value of $\nabla \cdot F$, we get

$$\begin{aligned} \iint_S \vec{F} \cdot \hat{n} \, ds &= \iint_v \int 14 \, dv && \text{where } v \text{ is volume of a sphere} \\ &= 14v \\ &= 14 \frac{4}{3} \pi (4)^3 = \frac{3584\pi}{3} && \text{Ans.} \end{aligned}$$

Example 103. Evaluate $\iint_S \vec{F} \cdot \hat{n} \, ds$ where $\vec{F} = 4xz\hat{i} - y^2\hat{j} + yz\hat{k}$ and S is the surface of the cube bounded by $x = 0, x = 1, y = 0, y = 1, z = 0, z = 1$.

(U.P., Ist Semester, 2009, Nagpur University, Winter 2003)

Solution. By Divergence theorem,

$$\begin{aligned} \iint_S \vec{F} \cdot \hat{n} \, ds &= \iint_v \int (\nabla \cdot \vec{F}) \, dv \\ &= \iiint_v \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (4xz\hat{i} - y^2\hat{j} + yz\hat{k}) \, dv \\ &= \iiint_v \left[\frac{\partial}{\partial x} (4xz) + \frac{\partial}{\partial y} (-y^2) + \frac{\partial}{\partial z} (yz) \right] dx \, dy \, dz \\ &= \iiint_v (4z - 2y + y) dx \, dy \, dz \\ &= \iiint_v (4z - y) dx \, dy \, dz = \int_0^1 \int_0^1 \left(\frac{4z^2}{2} - yz \right)_0^1 dx \, dy \\ &= \int_0^1 \int_0^1 (2z^2 - yz)_0^1 dx \, dy = \int_0^1 \int_0^1 (2 - y) dx \, dy \\ &= \int_0^1 \left(2y - \frac{y^2}{2} \right)_0^1 dx = \frac{3}{2} \int_0^1 dx = \frac{3}{2} [x]_0^1 = \frac{3}{2} (1) = \frac{3}{2} \text{ Ans.} \end{aligned}$$

Note: This question is directly solved as on example 14 on Page 574.

Example 104. Find $\iint_S \vec{F} \cdot \hat{n} \, ds$, where $\vec{F} = (2x + 3z)\hat{i} - (xz + y)\hat{j} + (y^2 + 2z)\hat{k}$ and S is the surface of the sphere having centre $(3, -1, 2)$ and radius 3.

(AMIETE, Dec. 2010, U.P., I Semester, Winter 2005, 2000)

Solution. Let V be the volume enclosed by the surface S .

By Divergence theorem, we've

$$\iint_S \vec{F} \cdot \hat{n} \, ds = \iiint_V \text{div } \vec{F} \, dv.$$

$$\text{Now, } \text{div } \vec{F} = \frac{\partial}{\partial x} (2x + 3z) + \frac{\partial}{\partial y} [-(xz + y)] + \frac{\partial}{\partial z} (y^2 + 2z) = 2 - 1 + 2 = 3$$

$$\therefore \iint_S \vec{F} \cdot \hat{n} \, ds = \iiint_V 3 \, dv = 3 \iiint_V \, dv = 3V.$$

Again V is the volume of a sphere of radius 3. Therefore

$$V = \frac{4}{3} \pi r^3 = \frac{4}{3} \pi (3)^3 = 36 \pi.$$

$$\therefore \iint_S \vec{F} \cdot \hat{n} \, ds = 3V = 3 \times 36 \pi = 108 \pi$$

Ans.

Example 105. Use Divergence Theorem to evaluate $\iint_S \vec{A} \cdot \vec{ds}$,

where $\vec{A} = x^3 \hat{i} + y^3 \hat{j} + z^3 \hat{k}$ and S is the surface of the sphere $x^2 + y^2 + z^2 = a^2$.

(AMIETE, Dec. 2009)

Solution. $\iint_S \vec{A} \cdot \vec{ds} = \iiint_V \operatorname{div} \vec{A} dV$

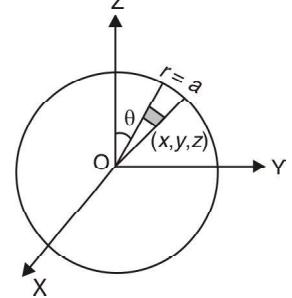

$$= \iiint_V \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x^3 \hat{i} + y^3 \hat{j} + z^3 \hat{k}) dV$$

$$= \iiint_V (3x^2 + 3y^2 + 3z^2) dV = 3 \iiint_V (x^2 + y^2 + z^2) dV$$

On putting $x = r \sin \theta \cos \phi$, $y = r \sin \theta \sin \phi$, $z = r \cos \theta$, we get

$$= 3 \iiint_V r^2 (r^2 \sin \theta dr d\theta d\phi) = 3 \times 8 \int_0^{\frac{\pi}{2}} d\phi \int_0^{\frac{\pi}{2}} \sin \theta d\theta \int_0^a r^4 dr$$

$$= 24 \left(\frac{\pi}{2} \right)_0^{\frac{\pi}{2}} (-\cos \theta)_0^{\frac{\pi}{2}} \left(\frac{r^5}{5} \right)_0^a = 24 \left(\frac{\pi}{2} \right) (-0+1) \left(\frac{a^5}{5} \right) = \frac{12\pi a^5}{5}$$

Ans.

Example 106. Use divergence Theorem to show that

$$\iint_S \nabla (x^2 + y^2 + z^2) \cdot \vec{ds} = 6 V$$

where S is any closed surface enclosing volume V . (U.P., I Semester, Winter 2002)

Solution. Here $\nabla (x^2 + y^2 + z^2) = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x^2 + y^2 + z^2)$

$$= 2x \hat{i} + 2y \hat{j} + 2z \hat{k} = 2(x \hat{i} + y \hat{j} + z \hat{k})$$

$$\therefore \iint_S \nabla (x^2 + y^2 + z^2) \cdot \vec{ds} = \iint_S \nabla (x^2 + y^2 + z^2) \cdot \hat{n} ds$$

\hat{n} being outward drawn unit normal vector to S

$$= \iint_S 2(x \hat{i} + y \hat{j} + z \hat{k}) \cdot \hat{n} ds$$

$$= 2 \iiint_V \operatorname{div} (x \hat{i} + y \hat{j} + z \hat{k}) dV \quad \dots(1)$$

(By Divergence Theorem)
(V being volume enclosed by S)

Now, $\operatorname{div} (x \hat{i} + y \hat{j} + z \hat{k}) = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x \hat{i} + y \hat{j} + z \hat{k})$

$$= \frac{\partial x}{\partial x} + \frac{\partial y}{\partial y} + \frac{\partial z}{\partial z} = 3 \quad \dots(2)$$

From (1) & (2), we have

$$\iint_S \nabla (x^2 + y^2 + z^2) \cdot \vec{ds} = 2 \iiint_V 3 dV = 6 \iiint_V dV = 6 V \quad \text{Proved.}$$

Example 107. Evaluate $\iint_S (y^2 z^2 \hat{i} + z^2 x^2 \hat{j} + z^2 y^2 \hat{k}) \cdot \hat{n} dS$, where S is the part of the sphere

$x^2 + y^2 + z^2 = 1$ above the xy -plane and bounded by this plane.

Solution. Let V be the volume enclosed by the surface S . Then by divergence Theorem, we have

$$\iint_S (y^2 z^2 \hat{i} + z^2 x^2 \hat{j} + z^2 y^2 \hat{k}) \cdot \hat{n} dS = \iiint_V \operatorname{div} (y^2 z^2 \hat{i} + z^2 x^2 \hat{j} + z^2 y^2 \hat{k}) dV$$

$$= \iiint_V \left[\frac{\partial}{\partial x} (y^2 z^2) + \frac{\partial}{\partial y} (z^2 x^2) + \frac{\partial}{\partial z} (z^2 y^2) \right] dV = \iint_V 2z y^2 dV = 2 \iint_V z y^2 dV$$

Changing to spherical polar coordinates by putting

$$x = r \sin \theta \cos \phi, \quad y = r \sin \theta \sin \phi, \quad z = r \cos \theta, \quad dV = r^2 \sin \theta \, dr \, d\theta \, d\phi$$

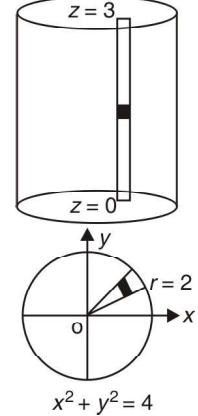

To cover V , the limits of r will be 0 to 1, those of θ will be 0 to $\frac{\pi}{2}$ and those of ϕ will be 0 to 2π .

$$\begin{aligned} \therefore 2 \iiint_V zy^2 \, dV &= 2 \int_0^{2\pi} \int_0^{\pi/2} \int_0^1 (r \cos \theta) (r^2 \sin^2 \theta \sin^2 \phi) r^2 \sin \theta \, dr \, d\theta \, d\phi \\ &= 2 \int_0^{2\pi} \int_0^{\pi/2} \int_0^1 r^5 \sin^3 \theta \cos \theta \sin^2 \phi \, dr \, d\theta \, d\phi \\ &= 2 \int_0^{2\pi} \int_0^{\pi/2} \sin^3 \theta \cos \theta \sin^2 \phi \left[\frac{r^6}{6} \right]_0^1 \, d\theta \, d\phi \\ &= \frac{2}{6} \int_0^{2\pi} \sin^2 \phi \cdot \frac{2}{4.2} \, d\phi = \frac{1}{12} \int_0^{2\pi} \sin^2 \phi \, d\phi = \frac{\pi}{12} \quad \text{Ans.} \end{aligned}$$

Example 108. Use Divergence Theorem to evaluate $\iint_S \vec{F} \cdot d\vec{S}$ where $\vec{F} = 4x\hat{i} - 2y^2\hat{j} + z^2\hat{k}$ and S is the surface bounding the region $x^2 + y^2 = 4$, $z = 0$ and $z = 3$.
(A.M.I.E.T.E., Summer 2003, 2001)

Solution. By Divergence Theorem,

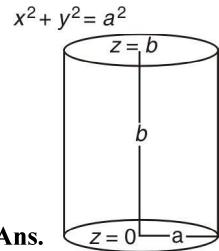

$$\begin{aligned} \iint_S \vec{F} \cdot d\vec{S} &= \iiint_V \operatorname{div} \vec{F} \, dV \\ &= \iiint_V \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (4x\hat{i} - 2y^2\hat{j} + z^2\hat{k}) \, dV \\ &= \iiint_V (4 - 4y + 2z) \, dx \, dy \, dz \\ &= \iint dx \, dy \int_0^3 (4 - 4y + 2z) \, dz = \iint dx \, dy [4z - 4yz + z^2]_0^3 \\ &= \iint (12 - 12y + 9) \, dx \, dy = \iint (21 - 12y) \, dx \, dy \\ \text{Let us put } x = r \cos \theta, y = r \sin \theta & \\ &= \iint (21 - 12r \sin \theta) r \, d\theta \, dr = \int_0^{2\pi} d\theta \int_0^2 (21r - 12r^2 \sin \theta) \, dr \\ &= \int_0^{2\pi} d\theta \left[\frac{21r^2}{2} - 4r^3 \sin \theta \right]_0^2 = \int_0^{2\pi} d\theta (42 - 32 \sin \theta) = (42\theta + 32 \cos \theta) \Big|_0^{2\pi} \\ &= 84\pi + 32 - 32 = 84\pi \quad \text{Ans.} \end{aligned}$$

Example 109. Apply the Divergence Theorem to compute $\iint_S \vec{u} \cdot \hat{n} \, ds$, where s is the surface of the cylinder $x^2 + y^2 = a^2$ bounded by the planes $z = 0$, $z = b$ and where $\vec{u} = \hat{i}x - \hat{j}y + \hat{k}z$.

Solution. By Gauss's Divergence Theorem

$$\begin{aligned} \iint_S \vec{u} \cdot \hat{n} \, ds &= \iiint_V (\nabla \cdot \vec{u}) \, dv \\ &= \iiint_V \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (\hat{i}x - \hat{j}y + \hat{k}z) \, dv \\ &= \iiint_V \left(\frac{\partial x}{\partial x} - \frac{\partial y}{\partial y} + \frac{\partial z}{\partial z} \right) \, dv = \iiint_V (1 - 1 + 1) \, dv \\ &= \iiint_V \, dv = \iiint_V \, dx \, dy \, dz = \text{Volume of the cylinder} = \pi a^2 b \quad \text{Ans.} \end{aligned}$$

Example 110. Apply Divergence Theorem to evaluate $\iiint_V \vec{F} \cdot \hat{n} ds$, where

$\vec{F} = 4x^3\hat{i} - x^2y\hat{j} + x^2z\hat{k}$ and S is the surface of the cylinder $x^2 + y^2 = a^2$ bounded by the planes $z = 0$ and $z = b$.
(U.P. Ist Semester, Dec. 2006)

Solution. We have,

$$\begin{aligned} \vec{F} &= 4x^3\hat{i} - x^2y\hat{j} + x^2z\hat{k} \\ \therefore \operatorname{div} \vec{F} &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (4x^3\hat{i} - x^2y\hat{j} + x^2z\hat{k}) \\ &= \frac{\partial}{\partial x} (4x^3) + \frac{\partial}{\partial y} (-x^2y) + \frac{\partial}{\partial z} (x^2z) = 12x^2 - x^2 + x^2 = 12x^2 \end{aligned}$$

$$\begin{aligned} \text{Now, } \iiint_V \operatorname{div} \vec{F} dV &= 12 \int_{x=-a}^a \int_{y=-\sqrt{a^2-x^2}}^{\sqrt{a^2-x^2}} \int_{z=0}^b x^2 dz dy dx \\ &= 12 \int_{x=-a}^a \int_{y=-\sqrt{a^2-x^2}}^{\sqrt{a^2-x^2}} x^2 (z)_0^b dy dx = 12b \int_{-a}^a x^2 (y) \int_{-\sqrt{a^2-x^2}}^{\sqrt{a^2-x^2}} dx \\ &= 12b \int_{-a}^a x^2 \cdot 2\sqrt{a^2-x^2} dx &= 24b \int_{-a}^a x^2 \sqrt{a^2-x^2} dx \\ &= 48b \int_0^a x^2 \sqrt{a^2-x^2} dx &[\text{Put } x = a \sin \theta, dx = a \cos \theta d\theta] \\ &= 48b \int_0^{\pi/2} a^2 \sin^2 \theta a \cos \theta a \cos \theta d\theta \\ &= 48ba^4 \int_0^{\pi/2} \sin^2 \theta \cdot \cos^2 \theta d\theta = 48ba^4 \frac{1}{2} \int_0^{\pi/2} \frac{1}{2} d\theta \\ &= 48ba^4 \frac{1}{2} \frac{\sqrt{\pi}}{2} \cdot \frac{1}{2} \frac{\sqrt{\pi}}{2} = 3b a^4 \pi \end{aligned}$$

Ans.

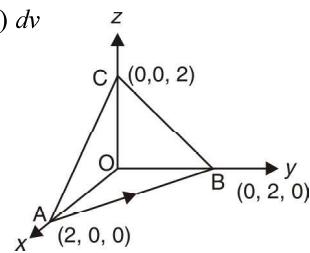

Example 111. Evaluate surface integral $\iint_S \vec{F} \cdot \hat{n} ds$, where $\vec{F} = (x^2 + y^2 + z^2)(\hat{i} + \hat{j} + \hat{k})$, S is the surface of the tetrahedron $x = 0, y = 0, z = 0, x + y + z = 2$ and n is the unit normal in the outward direction to the closed surface S .

Solution. By Divergence theorem

$$\iint_S \vec{F} \cdot \hat{n} ds = \iiint_V \operatorname{div} \vec{F} \cdot dv$$

where S is the surface of tetrahedron $x = 0, y = 0, z = 0, x + y + z = 2$

$$\begin{aligned} &= \iiint_V \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x^2 + y^2 + z^2)(\hat{i} + \hat{j} + \hat{k}) dv \\ &= \iiint_V (2x + 2y + 2z) dv \\ &= 2 \iiint_V (x + y + z) dx dy dz \\ &= 2 \int_0^2 dx \int_0^{2-x} dy \int_0^{2-x-y} (x + y + z) dz \\ &= 2 \int_0^2 dx \int_0^{2-x} dy \left(xz + yz + \frac{z^2}{2} \right)_0^{2-x-y} \end{aligned}$$

$$\begin{aligned}
&= 2 \int_0^2 dx \int_0^{2-x} dy \left(2x - x^2 - xy + 2y - xy - y^2 + \frac{(2-x-y)^2}{2} \right) \\
&= 2 \int_0^2 dx \left[2xy - x^2 y - x y^2 + y^2 - \frac{y^3}{3} - \frac{(2-x-y)^3}{6} \right]_0^{2-x} \\
&= 2 \int_0^2 dx \left[2x(2-x) - x^2(2-x) - x(2-x)^2 + (2-x)^2 - \frac{(2-x)^3}{3} + \frac{(2-x)^3}{6} \right] \\
&= 2 \int_0^2 \left(4x - 2x^2 - 2x^2 + x^3 - 4x + 4x^2 - x^3 + (2-x)^2 - \frac{(2-x)^3}{3} + \frac{(2-x)^3}{6} \right) dx \\
&= 2 \left[2x^2 - \frac{4x^3}{3} + \frac{x^4}{4} - 2x^2 + \frac{4x^3}{3} - \frac{x^4}{4} - \frac{(2-x)^3}{3} + \frac{(2-x)^4}{12} - \frac{(2-x)^4}{24} \right]_0^2 \\
&= 2 \left[-\frac{(2-x)^3}{3} + \frac{(2-x)^4}{12} - \frac{(2-x)^4}{24} \right]_0^2 = 2 \left[\frac{8}{3} - \frac{16}{12} + \frac{16}{24} \right] = 4 \quad \text{Ans.}
\end{aligned}$$

Example 112. Use the Divergence Theorem to evaluate

$$\iint_S (x \, dy \, dz + y \, dz \, dx + z \, dx \, dy)$$

where S is the portion of the plane $x + 2y + 3z = 6$ which lies in the first Octant.
(U.P., I Semester, Winter 2003)

Solution. $\iint_S (f_1 \, dy \, dz + f_2 \, dx \, dz + f_3 \, dx \, dy)$

$$= \iiint_V \left(\frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z} \right) dx \, dy \, dz$$

where S is a closed surface bounding a volume V .

$$\therefore \iint_S (x \, dy \, dz + y \, dz \, dx + z \, dx \, dy)$$

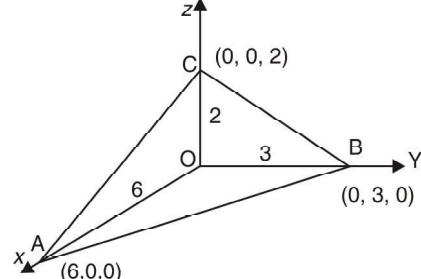

$$= \iiint_V \left(\frac{\partial x}{\partial x} + \frac{\partial y}{\partial y} + \frac{\partial z}{\partial z} \right) dx \, dy \, dz$$

$$= \iiint_V (1+1+1) dx \, dy \, dz = 3 \iiint_V dx \, dy \, dz$$

= 3 (Volume of tetrahedron $OABC$)

$$= 3 \left[\frac{1}{3} \text{Area of the base } \Delta OAB \times \text{height } OC \right]$$

$$= 3 \left[\frac{1}{3} \left(\frac{1}{2} \times 6 \times 3 \right) \times 2 \right] = 18 \quad \text{Ans.}$$

Example 113. Use Divergence Theorem to evaluate : $\iint_S (x \, dy \, dz + y \, dz \, dx + z \, dx \, dy)$ over the surface of a sphere radius a . (K. University, Dec. 2009)

Solution. Here, we have

$$\iint_S [x \, dy \, dz + y \, dx \, dz + z \, dx \, dy]$$

$$= \iiint_V \left(\frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z} \right) dx \, dy \, dz = \iiint_V \left(\frac{\partial x}{\partial x} + \frac{\partial y}{\partial y} + \frac{\partial z}{\partial z} \right) dx \, dy \, dz$$

$$= \iiint_V (1+1+1) dx \, dy \, dz = 3 \text{ (volume of the sphere)}$$

$$= 3 \left(\frac{4}{3} \pi a^3 \right) = 4 \pi a^3 \quad \text{Ans.}$$

Example 114. Using the divergence theorem, evaluate the surface integral $\iint_S (yz dy dz + zx dz dx + xy dy dx)$ where $S : x^2 + y^2 + z^2 = 4$.

(AMIETE, Dec. 2010, UP, I Sem., Dec 2008)

Solution. $\iint_S (f_1 dy dz + f_2 dz dx + f_3 dx dy)$

$$= \iiint_V \left(\frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z} \right) dx dy dz$$

where S is closed surface bounding a volume V .

$$\therefore \iint_S (yz dy dz + zx dz dx + xy dx dy)$$

$$= \iiint_V \left(\frac{\partial (yz)}{\partial x} + \frac{\partial (zx)}{\partial y} + \frac{\partial (xy)}{\partial z} \right) dx dy dz = \iiint_V (0 + 0 + 0) dx dy dz$$

Ans.

Example 115. Evaluate $\iint_S xz^2 dy dz + (x^2 y - z^3) dz dx + (2xy + y^2 z) dx dy$

where S is the surface of hemispherical region bounded by

$$z = \sqrt{a^2 - x^2 - y^2} \text{ and } z = 0.$$

Solution. $\iint_S (f_1 dy dz + f_2 dz dx + f_3 dx dy) = \iiint_V \left(\frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z} \right) dx dy dz$

where S is a closed surface bounding a volume V .

$$\therefore \iint_S xz^2 dy dz + (x^2 y - z^3) dz dx + (2xy + y^2 z) dx dy$$

$$= \iiint_V \left[\frac{\partial}{\partial x} (xz^2) + \frac{\partial}{\partial y} (x^2 y - z^3) + \frac{\partial}{\partial z} (2xy + y^2 z) \right] dx dy dz$$

(Here V is the volume of hemisphere)

$$= \iiint_V (z^2 + x^2 + y^2) dx dy dz$$

Let $x = r \sin \theta \cos \phi$, $y = r \sin \theta \sin \phi$, $z = r \cos \theta$

$$= \iiint_V r^2 (r^2 \sin \theta dr d\theta d\phi) = \int_0^{2\pi} d\phi \int_0^{\pi} \sin \theta d\theta \int_0^a r^4 dr$$

$$= (\phi)_0^{2\pi} (-\cos \theta)_0^{\pi/2} \left(\frac{r^5}{5} \right)_0^a = 2\pi (-0 + 1) \frac{a^5}{5} = \frac{2\pi a^5}{5}$$

Ans.

Example 116. Evaluate $\iint_S \vec{F} \cdot \hat{n} ds$ over the entire surface of the region above the xy -plane

bounded by the cone $z^2 = x^2 + y^2$ and the plane $z = 4$, if $F = 4xz \hat{i} + xyz^2 \hat{j} + 3z \hat{k}$.

Solution. If V is the volume enclosed by S , then V is bounded by the surfaces $z = 0$, $z = 4$, $z^2 = x^2 + y^2$.

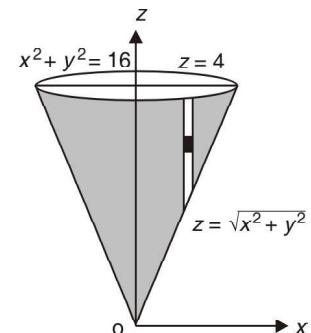

By divergence theorem, we have

$$\iint_S \vec{F} \cdot \hat{n} ds = \iiint_V \operatorname{div} \vec{F} dx dy dz$$

$$= \iiint_V \left[\frac{\partial}{\partial x} (4xz) + \frac{\partial}{\partial y} (xyz^2) + \frac{\partial}{\partial z} (3z) \right] dx dy dz$$

$$= \iiint_V (4z + xz^2 + 3) dx dy dz$$

Limits of z are $\sqrt{x^2 + y^2}$ and 4.

$$\begin{aligned}
\iiint_{\sqrt{x^2+y^2}}^4 (4z + xz^2 + 3) \, dz \, dy \, dx &= \iint \left[2z^2 + \frac{xz^3}{3} + 3z \right]_{\sqrt{x^2+y^2}}^4 \, dy \, dx \\
&= \iint \left[\left(32 + \frac{64x}{3} + 12 \right) - \{2(x^2 + y^2) + x(x^2 + y^2)^{3/2} + 3\sqrt{x^2 + y^2}\} \right] \, dy \, dx \\
&= \iint \left(44 + \frac{64x}{3} - 2(x^2 + y^2) - x(x^2 + y^2)^{3/2} - 3\sqrt{x^2 + y^2} \right) \, dy \, dx
\end{aligned}$$

Putting $x = r \cos \theta$ and $y = r \sin \theta$, we have

$$= \iint \left(44 + \frac{64r \cos \theta}{3} - 2r^2 - r \cos \theta r^3 - 3r \right) r \, d\theta \, dr$$

Limits of r are 0 to 4.

and limits of θ are 0 to 2π .

$$\begin{aligned}
&= \int_0^{2\pi} \int_0^4 \left(44r + \frac{64r^2 \cos \theta}{3} - 2r^3 - r^5 \cos \theta - 3r^2 \right) d\theta \, dr \\
&= \int_0^{2\pi} \left[22r^2 + \frac{64 \times r^3 \cos \theta}{9} - \frac{r^4}{2} - \frac{r^6}{6} \cos \theta - r^3 \right]_0^4 d\theta \\
&= \int_0^{2\pi} \left[22(4)^2 + \frac{64 \times (4)^3 \cos \theta}{9} - \frac{(4)^4}{2} - \frac{(4)^6}{6} \cos \theta - (4)^3 \right] d\theta \\
&= \int_0^{2\pi} \left[352 + \frac{64 \times 64}{9} \cos \theta - 128 - \frac{(4)^6}{6} \cos \theta - 64 \right] d\theta \\
&= \int_0^{2\pi} \left[160 + \left(\frac{64 \times 64}{9} - \frac{(4)^6}{6} \right) \cos \theta \right] d\theta \\
&= \left[160 \theta + \left(\frac{64 \times 64}{9} - \frac{(4)^6}{6} \right) \sin \theta \right]_0^{2\pi} = 160(2\pi) + \left(\frac{64 \times 64}{9} - \frac{(4)^6}{6} \right) \sin 2\pi \\
&= 320 \pi
\end{aligned}$$

Ans.

Example 117. The vector field $\vec{F} = x^2 \hat{i} + z \hat{j} + yz \hat{k}$ is defined over the volume of the cuboid given by $0 \leq x \leq a$, $0 \leq y \leq b$, $0 \leq z \leq c$, enclosing the surface S . Evaluate the surface integral

$$\iint_S \vec{F} \cdot \vec{ds} \quad (U.P., I \text{ Semester, Winter 2001})$$

Solution. By Divergence Theorem, we have

$$\iint_S (x^2 \hat{i} + z \hat{j} + yz \hat{k}) \cdot ds = \iiint_V \operatorname{div} (x^2 \hat{i} + z \hat{j} + yz \hat{k}) \, dv,$$

where V is the volume of the cuboid enclosing the surface S .

$$\begin{aligned}
&= \iiint_V \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (x^2 \hat{i} + z \hat{j} + yz \hat{k}) \, dv \\
&= \iiint_V \left\{ \frac{\partial}{\partial x} (x^2) + \frac{\partial}{\partial y} (z) + \frac{\partial}{\partial z} (yz) \right\} \, dx \, dy \, dz \\
&= \int_{x=0}^a \int_{y=0}^b \int_{z=0}^c (2x + y) \, dx \, dy \, dz = \int_0^a dx \int_0^b dy \int_0^c (2x + y) \, dz \\
&= \int_0^a dx \int_0^b \left[2xz + yz \right]_0^c dy = \int_0^a dx \int_0^b (2xc + yc) \, dy
\end{aligned}$$

$$\begin{aligned}
&= c \int_0^a dx \int_0^b (2x + y) dy = c \int_0^a \left[2xy + \frac{y^2}{2} \right]_0^b dx = c \int_0^a \left(2bx + \frac{b^2}{2} \right) dx \\
&= c \left[\frac{2bx^2}{2} + \frac{b^2 x}{2} \right]_0^a = c \left[a^2 b + \frac{ab^2}{2} \right] = abc \left(a + \frac{b}{2} \right) \quad \text{Ans.}
\end{aligned}$$

Example 118. Verify the divergence Theorem for the function $\vec{F} = 2x^2yi - y^2j + 4xz^2k$ taken over the region in the first octant bounded by $y^2 + z^2 = 9$ and $x = 2$.

Solution. $\iiint_V \nabla \cdot \vec{F} dV = \iiint_V \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (2x^2y\hat{i} - y^2\hat{j} + 4xz^2\hat{k}) dV$

$$\begin{aligned}
&= \iiint_V (4xy - 2y + 8xz) dx dy dz = \int_0^2 dx \int_0^3 dy \int_0^{\sqrt{9-y^2}} (4xy - 2y + 8xz) dz \\
&= \int_0^2 dx \int_0^3 dy (4xyz - 2yz + 4xz^2) \Big|_0^{\sqrt{9-y^2}} \\
&= \int_0^2 dx \int_0^3 [4xy\sqrt{9-y^2} - 2y\sqrt{9-y^2} + 4x(9-y^2)] dy \\
&= \int_0^2 dx \left[-\frac{4x}{2} \frac{2}{3} (9-y^2)^{3/2} + \frac{2}{3} (9-y^2)^{3/2} + 36xy - \frac{4xy^3}{3} \right]_0^3 \\
&= \int_0^2 (0 + 0 + 108x - 36x + 36x - 18) dx = \int_0^2 (108x - 18) dx = \left[108 \frac{x^2}{2} - 18x \right]_0^2 \\
&= 216 - 36 = 180 \quad \dots(1)
\end{aligned}$$

Here $\iint_S \vec{F} \cdot \hat{n} ds = \iint_{OABC} \vec{F} \cdot \hat{n} ds + \iint_{OCE} \vec{F} \cdot \hat{n} ds + \iint_{ODE} \vec{F} \cdot \hat{n} ds + \iint_{ABD} \vec{F} \cdot \hat{n} ds + \iint_{BDEC} \vec{F} \cdot \hat{n} ds$

$$\iint_{BDEC} \vec{F} \cdot \hat{n} ds = \iint_{BDEC} (2x^2y\hat{i} - y^2\hat{j} + 4xz^2\hat{k}) \cdot \hat{n} ds$$

Normal vector

$$\begin{aligned}
\nabla \phi &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) (y^2 + z^2 - 9) \\
&= 2y\hat{j} + 2z\hat{k}
\end{aligned}$$

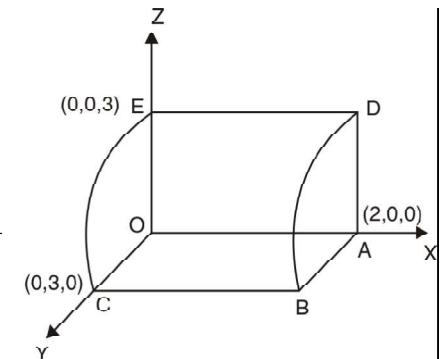

$$\begin{aligned}
\text{Unit normal vector} &= \hat{n} = \frac{2y\hat{j} + 2z\hat{k}}{\sqrt{4y^2 + 4z^2}} = \frac{y\hat{j} + z\hat{k}}{\sqrt{y^2 + z^2}} \\
&= \frac{y\hat{j} + z\hat{k}}{\sqrt{9}} = \frac{y\hat{j} + z\hat{k}}{3}
\end{aligned}$$

$$\iint_{BDEC} (2x^2y\hat{i} - y^2\hat{j} + 4xz^2\hat{k}) \cdot \frac{y\hat{j} + z\hat{k}}{3} ds = \frac{1}{3} \iint_{BDEC} (-y^3 + 4xz^3) ds$$

$$\left[dx dy = ds (\hat{n} \cdot k) = ds \left(\frac{y\hat{j} + z\hat{k}}{3} \cdot \hat{k} \right) = ds \frac{z}{3} \text{ or } ds = \frac{dx dy}{\frac{z}{3}} \right]$$

$$\begin{aligned}
&= \frac{1}{3} \iint_{BDEC} (-y^3 + 4xz^3) \frac{dx dy}{\frac{z}{3}} = \int_0^2 dx \int_0^3 \left(-\frac{y^3}{z} + 4xz^2 \right) dy \quad \begin{cases} y = 3 \sin \theta, \\ z = 3 \cos \theta \end{cases}
\end{aligned}$$

$$\begin{aligned}
&= \int_0^2 dx \int_0^{\frac{\pi}{2}} \left[\frac{-27 \sin^3 \theta}{3 \cos \theta} + 4x(9 \cos^2 \theta) \right]
\end{aligned}$$

$$\begin{aligned}
&= \int_0^2 dx \left(-27 \times \frac{2}{3} + 108 x \times \frac{2}{3} \right) = \int_0^2 (-18 + 72x) dx \\
&= \left[-18x + 36x^2 \right]_0^2 = 108
\end{aligned} \quad \dots(2)$$

$$\begin{aligned}
\iint_{OABC} \vec{F} \cdot \hat{n} ds &= \iint_{OABC} (2x^2 y \hat{i} - y^2 \hat{j} + 4xz^2 \hat{k}) \cdot (-\hat{k}) ds \\
&= \iint_{OABC} 4xz^2 ds = 0
\end{aligned} \quad \dots(3) \text{ because in } OABC \text{ } xy\text{-plane, } z = 0$$

$$\iint_{OADE} \vec{F} \cdot \hat{n} ds = \iint_{OADE} (2x^2 y \hat{i} - y^2 \hat{j} + 4xz^2 \hat{k}) \cdot (-\hat{j}) ds = \iint_{OADE} y^2 ds = 0$$

...because in $OADE$ xz -plane, $y = 0$ \dots(4)

$$\iint_{OCE} \vec{F} \cdot \hat{n} ds = \iint_{OCE} (2x^2 y \hat{i} - y^2 \hat{j} + 4xz^2 \hat{k}) \cdot (-\hat{i}) ds = \iint_{OCE} -2x^2 y ds = 0$$

...because in OCE yz -plane, $x = 0$ \dots(5)

$$\begin{aligned}
\iint_{ABD} \vec{F} \cdot \hat{n} ds &= \iint_{ABD} (2x^2 y \hat{i} - y^2 \hat{j} + 4xz^2 \hat{k}) \cdot (\hat{i}) ds = \iint_{ABD} 2x^2 y ds \\
&= \iint 2x^2 y dy dz = \int_0^3 dz \int_0^{\sqrt{9-z^2}} 2(2)^2 y dy \quad \text{because in } ABD \text{ plane, } x = 2 \\
&= 8 \int_0^3 dz \left[\frac{y^3}{3} \right]_0^{\sqrt{9-z^2}} = 4 \int_0^3 dz (9-z^2) = 4 \left[9z - \frac{z^3}{3} \right]_0^3 = 4 [27-9] = 72
\end{aligned} \quad \dots(6)$$

On adding (2), (3), (4), (5) and (6), we get

$$\iint_S \vec{F} \cdot \hat{n} ds = 108 + 0 + 0 + 0 + 72 = 180 \quad \dots(7)$$

From (1) and (7), we have $\iiint_V \nabla \cdot \vec{F} dV = \iint_S \vec{F} \cdot \hat{n} ds$

Hence the theorem is verified.

Example 119. Verify the Gauss divergence Theorem for

$$\vec{F} = (x^2 - yz) \hat{i} + (y^2 - zx) \hat{j} + (z^2 - xy) \hat{k} \text{ taken over the rectangular parallelopiped } 0 \leq x \leq a, 0 \leq y \leq b, 0 \leq z \leq c. \quad (\text{U.P., I Semester, Compartment 2002})$$

Solution. We have

$$\begin{aligned}
\operatorname{div} \vec{F} &= \nabla \cdot \vec{F} = \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot [(x^2 - yz) \hat{i} + (y^2 - zx) \hat{j} + (z^2 - xy) \hat{k}] \\
&= \frac{\partial}{\partial x} (x^2 - yz) + \frac{\partial}{\partial y} (y^2 - zx) + \frac{\partial}{\partial z} (z^2 - xy) = 2x + 2y + 2z
\end{aligned}$$

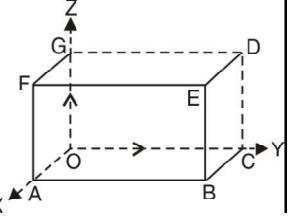

$$\begin{aligned}
\therefore \text{Volume integral} &= \iiint_V \nabla \cdot \vec{F} dV = \iiint_V 2(x + y + z) dV \\
&= 2 \int_{x=0}^a \int_{y=0}^b \int_{z=0}^c (x + y + z) dx dy dz = 2 \int_0^a dx \int_0^b dy \int_0^c (x + y + z) dz \\
&= 2 \int_0^a dx \int_0^b dy \left(xz + yz + \frac{z^2}{2} \right)_0^c = 2 \int_0^a dx \int_0^b dy \left(cx + cy + \frac{c^2}{2} \right) \\
&= 2 \int_0^a dx \left(cx^2 + c \frac{y^2}{2} + \frac{c^2 y}{2} \right)_0^b = 2 \int_0^a dx \left(bcx + \frac{b^2 c}{2} + \frac{b c^2}{2} \right)
\end{aligned}$$

$$\begin{aligned}
&= 2 \left[\frac{bcx^2}{2} + \frac{b^2 cx}{2} + \frac{bc^2 x}{2} \right]_0^a = [a^2 bc + ab^2 c + abc^2] \\
&= abc (a + b + c) \quad \dots(A)
\end{aligned}$$

To evaluate $\iint_S \vec{F} \cdot \hat{n} ds$, where S consists of six plane surfaces.

$$\begin{aligned}
\iint_S \vec{F} \cdot \hat{n} ds &= \iint_{OABC} \vec{F} \cdot \hat{n} ds + \iint_{DEFG} \vec{F} \cdot \hat{n} ds + \iint_{OAFG} \vec{F} \cdot \hat{n} ds \\
&\quad + \iint_{BCDE} \vec{F} \cdot \hat{n} ds + \iint_{ABEF} \vec{F} \cdot \hat{n} ds + \iint_{OCDG} \vec{F} \cdot \hat{n} ds
\end{aligned}$$

$$\begin{aligned}
\iint_{OABC} \vec{F} \cdot \hat{n} ds &= \iint_{OABC} \{(x^2 - yz)\hat{i} + (y^2 - xz)\hat{j} + (z^2 - xy)\hat{k}\} \\
&= - \iint_{00}^{ab} (z^2 - xy) dx dy \\
&= - \iint_{00}^{ab} (0 - xy) dx dy = \frac{a^2 b^2}{4} \quad \dots(1)
\end{aligned}$$

$$\begin{aligned}
\iint_{DEFG} \vec{F} \cdot \hat{n} ds &= \iint_{DEFG} \{(x^2 - yz)\hat{i} + (y^2 - xz)\hat{j} + (z^2 - xy)\hat{k}\} (\hat{k}) dx dy \\
&= \iint_{00}^{ab} (z^2 - xy) dx dy = \iint_{00}^{ab} (c^2 - xy) dx dy \\
&= \iint_{00}^{ab} \left[c^2 y - \frac{xy^2}{2} \right] dx = \iint_{00}^{ab} \left(c^2 b - \frac{xb^2}{2} \right) dx \\
&= \left[c^2 bx - \frac{x^2 b^2}{4} \right]_0^a = abc^2 - \frac{a^2 b^2}{4} \quad \dots(2)
\end{aligned}$$

| S.No. | Surface | Outward normal | ds | |
|-------|---------|----------------|---------|---------|
| 1 | OABC | $-k$ | $dx dy$ | $z = 0$ |
| 2 | DEFG | k | $dx dy$ | $z = c$ |
| 3 | OAFG | $-j$ | $dx dz$ | $y = 0$ |
| 4 | BCDE | j | $dx dz$ | $y = b$ |
| 5 | ABEF | i | $dy dz$ | $x = a$ |
| 6 | OCDG | $-i$ | $dy dz$ | $x = 0$ |

$$\begin{aligned}
\iint_{OAFG} \vec{F} \cdot \hat{n} ds &= \iint_{OAFG} \{(x^2 - yz)\hat{i} + (y^2 - zx)\hat{j} + (z^2 - xy)\hat{k}\} (-\hat{j}) dx dz \\
&= - \iint_{OAFG} (y^2 - zx) dx dz \\
&= - \int_0^a dx \int_0^c (0 - zx) dz = \int_0^a dx \left(\frac{xz^2}{2} \right)_0^c = \int_0^a \frac{x c^2}{2} dx = \left[\frac{x^2 c^2}{4} \right]_0^a = \frac{a^2 c^2}{4} \quad \dots(3)
\end{aligned}$$

$$\begin{aligned}
\iint_{BCDE} \vec{F} \cdot \hat{n} ds &= \iint_{BCDE} \{(x^2 - yz)\hat{i} + (y^2 - zx)\hat{j} + (z^2 - xy)\hat{k}\} \cdot \hat{j} dx dz = \iint_{BCDE} (y^2 - zx) dx dz \\
&= - \int_0^a dx \int_0^c (b^2 - xz) dz = \int_0^a dx \left(b^2 z - \frac{xz^2}{2} \right)_0^c = \int_0^a \left(b^2 c - \frac{xc^2}{2} \right) dx \\
&= \left[b^2 c x - \frac{x^2 c^2}{4} \right]_0^a = ab^2 c - \frac{a^2 c^2}{4} \quad \dots(4)
\end{aligned}$$

$$\begin{aligned}
\iint_{ABEF} \vec{F} \cdot \hat{n} ds &= \iint_{ABEF} \{(x^2 - yz)\hat{i} + (y^2 - zx)\hat{j} + (z^2 - xy)\hat{k}\} \cdot \hat{i} dy dz \\
&= \iint_{ABEF} (x^2 - yz) dy dz = \int_0^b dy \int_0^c (a^2 - yz) dz = \int_0^b dy \left(a^2 z - \frac{yz^2}{2} \right)_0^c
\end{aligned}$$

$$= \int_0^b \left(a^2 c - \frac{y c^2}{2} \right) dy = \left[a^2 c y - \frac{y^2 c^2}{4} \right]_0^b = a^2 b c - \frac{b^2 c^2}{4} \quad \dots(5)$$

$$\begin{aligned} \iint_{OCDG} \vec{F} \cdot \hat{n} ds &= \iint_{OCDG} \{(x^2 - yz)\hat{i} + (y^2 - zx)\hat{j} + (z^2 - xy)\hat{k}\} \cdot (-\hat{i}) dy dz \\ &= \int_0^b \int_0^c (x^2 - yz) dy dz = - \int_0^b dy \int_0^c (-yz) dz = - \int_0^b dy \left[\frac{-yz^2}{2} \right]_0^c \\ &= \int_0^b \frac{yc^2}{2} dy = \left[\frac{y^2 c^2}{4} \right]_0^b = \frac{b^2 c^2}{4} \end{aligned} \quad \dots(6)$$

Adding (1), (2), (3), (4), (5) and (6), we get

$$\begin{aligned} \iint \vec{F} \cdot \hat{n} ds &= \left(\frac{a^2 b^2}{4} \right) + \left(abc^2 - \frac{a^2 b^2}{4} \right) + \left(\frac{a^2 c^2}{4} \right) + \left(ab^2 c - \frac{a^2 c^2}{4} \right) \\ &\quad + \left(\frac{b^2 c^2}{4} \right) + \left(a^2 b c - \frac{b^2 c^2}{4} \right) \\ &= abc^2 + ab^2 c + a^2 bc \\ &= abc(a + b + c) \end{aligned} \quad \dots(B)$$

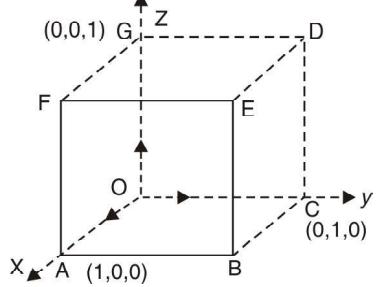

From (A) and (B), Gauss divergence Theorem is verified.

Verified.

Example 120. Verify Divergence Theorem, given that $\vec{F} = 4xzi - y^2\hat{j} + yz\hat{k}$ and S is the surface of the cube bounded by the planes $x = 0, x = 1, y = 0, y = 1, z = 0, z = 1$.

$$\begin{aligned} \text{Solution. } \nabla \cdot \vec{F} &= \left(\hat{i} \frac{\partial}{\partial x} + \hat{j} \frac{\partial}{\partial y} + \hat{k} \frac{\partial}{\partial z} \right) \cdot (4zx\hat{i} - y^2\hat{j} + yz\hat{k}) \\ &= 4z - 2y + y \\ &= 4z - y \end{aligned}$$

$$\begin{aligned} \text{Volume Integral} &= \iiint \nabla \cdot \vec{F} dv \\ &= \iiint (4z - y) dx dy dz \\ &= \int_0^1 dx \int_0^1 dy \int_0^1 (4z - y) dz \\ &= \int_0^1 dx \int_0^1 dy \int_0^1 (2z^2 - yz) dz = \int_0^1 dx \int_0^1 dy (2 - y) \\ &= \int_0^1 dx \left(2y - \frac{y^2}{2} \right)_0^1 = \int_0^1 dx \left(2 - \frac{1}{2} \right) = \frac{3}{2} \int_0^1 dx = \frac{3}{2} (x)_0^1 = \frac{3}{2} \end{aligned} \quad \dots(1)$$

To evaluate $\iint_S \vec{F} \cdot \hat{n} ds$, where S consists of six plane surfaces.

Over the face $OABC, z = 0, dz = 0, \hat{n} = -\hat{k}, ds = dx dy$

$$\iint \vec{F} \cdot \hat{n} ds = \int_0^1 \int_0^1 (-y^2\hat{j}) \cdot (-\hat{k}) dx dy = 0$$

Over the face $BCDE, y = 1, dy = 0$

$$\begin{aligned}\iint \vec{F} \cdot \hat{n} \, ds &= \int_0^1 \int_0^1 (4xz\hat{i} - \hat{j} + zk\hat{k}) \cdot (\hat{j}) \, dx \, dz \\ \hat{n} &= \hat{j}, \, ds = dx \, dz = \int_0^1 \int_0^1 -dx \, dz \\ &= - \int_0^1 dx \int_0^1 dz = -(x)_0^1 (z)_0^1 = -(1)(1) = -1\end{aligned}$$

Over the face $DEFG, z = 1, dz = 0, \hat{n} = \hat{k}, ds = dx \, dy$

$$\begin{aligned}\iint \vec{F} \cdot \hat{n} \, ds &= \int_0^1 \int_0^1 [4x(1) - y^2\hat{j} + y(1)\hat{k}] \cdot (\hat{k}) \, dx \, dy \\ &= \int_0^1 \int_0^1 y \, dx \, dy = \int_0^1 dx \int_0^1 y \, dy = (x)_0^1 \left(\frac{y^2}{2} \right)_0^1 = \frac{1}{2}\end{aligned}$$

Over the face $OCDG, x = 0, dx = 0, \hat{n} = -\hat{i}, ds = dy \, dz$

$$\iint \vec{F} \cdot \hat{n} \, ds = \int_0^1 \int_0^1 (0\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot (-\hat{i}) \, dy \, dz = 0$$

Over the face $AOGF, y = 0, dy = 0, \hat{n} = -\hat{j}, ds = dx \, dz$

$$\iint \vec{F} \cdot \hat{n} \, ds = \int_0^1 \int_0^1 (4xz\hat{i}) \cdot (-\hat{j}) \, dx \, dz = 0$$

Over the face $ABEF, x = 1, dx = 0, \hat{n} = \hat{i}, ds = dy \, dz$

$$\begin{aligned}\iint \vec{F} \cdot \hat{n} \, ds &= \int_0^1 \int_0^1 [(4z\hat{i} - y^2\hat{j} + yz\hat{k}) \cdot (\hat{i})] \, dy \, dz = \int_0^1 \int_0^1 4z \, dy \, dz \\ &= \int_0^1 dy \int_0^1 4z \, dz = \int_0^1 dy (2z^2)_0^1 = 2 \int_0^1 dy = 2(y)_0^1 = 2\end{aligned}$$

On adding we see that over the whole surface

$$\iint \vec{F} \cdot \hat{n} \, ds = \left(0 - 1 + \frac{1}{2} + 0 + 0 + 2 \right) = \frac{3}{2} \quad \dots(2)$$

From (1) and (2), we have $\iiint_V \nabla \cdot \vec{F} \, dv = \iint_S \vec{F} \cdot \hat{n} \, ds$ **Verified.**

EXERCISE 5.15

1. Use Divergence Theorem to evaluate $\iint_S (y^2z^2\hat{i} + z^2x^2\hat{j} + x^2y^2\hat{k}) \cdot \vec{ds}$,

where S is the upper part of the sphere $x^2 + y^2 + z^2 = 9$ above xy -plane.

Ans. $\frac{243\pi}{8}$

2. Evaluate $\iint_S (\nabla \times \vec{F}) \cdot \vec{ds}$, where S is the surface of the paraboloid $x^2 + y^2 + z = 4$ above the xy -plane and $\vec{F} = (x^2 + y - 4)\hat{i} + 3xy\hat{j} + (2xz + z^2)\hat{k}$.

Ans. -4π

3. Evaluate $\iint_S [xz^2 \, dy \, dz + (x^2y - z^3) \, dz \, dx + (2xy + y^2z) \, dx \, dy]$, where S is the surface enclosing a region bounded by hemisphere $x^2 + y^2 + z^2 = 4$ above XY -plane.

4. Verify Divergence Theorem for $\vec{F} = x^2\hat{i} + z\hat{j} + yz\hat{k}$, taken over the cube bounded by $x = 0, x = 1, y = 0, y = 1, z = 0, z = 1$.

5. Evaluate $\iint_S (2xy\hat{i} + yz^2\hat{j} + xz\hat{k}) \cdot \vec{ds}$ over the surface of the region bounded by

$x = 0, y = 0, y = 3, z = 0$ and $x + 2z = 6$

Ans. $\frac{351}{2}$

6. Verify Divergence Theorem for $\vec{F} = (x + y^2) \hat{i} - 2x \hat{j} + 2yz \hat{k}$ and the volume of a tetrahedron bounded by co-ordinate planes and the plane $2x + y + 2z = 6$.

(Nagpur, Winter 2000, A.M.I.E.T.E., Winter 2000)

7. Verify Divergence Theorem for the function $\vec{F} = y\hat{i} + x\hat{j} + z^2\hat{k}$ over the region bounded by $x^2 + y^2 = 9$, $z = 0$ and $z = 2$.

8. Use the Divergence Theorem to evaluate $\iint_S x^3 dy dz + x^2 y dz dx + x^2 z dx dy$, where S is the surface of the region bounded by the closed cylinder

$$x^2 + y^2 = a^2, (0 \leq z \leq b) \text{ and } z = 0, z = b.$$

Ans. $\frac{5\pi a^4 b}{4}$

9. Evaluate the integral $\iint_S (z^2 - x) dy dz - xy dx dz + 3z dx dy$, where S is the surface of closed region bounded by $z = 4 - y^2$ and planes $x = 0$, $x = 3$, $z = 0$ by transforming it with the help of Divergence Theorem to a triple integral.

Ans. 16

10. Evaluate $\iint_S \frac{ds}{\sqrt{a^2 x^2 + b^2 y^2 + c^2 z^2}}$ over the closed surface of the ellipsoid $ax^2 + by^2 + cz^2 = 1$ by applying Divergence Theorem.

Ans. $\frac{4\pi}{\sqrt{(a b c)}}$

11. Apply Divergence Theorem to evaluate $\iint(l x^2 + m y^2 + n z^2) ds$ taken over the sphere $(x - a)^2 + (y - b)^2 + (z - c)^2 = r^2$, l, m, n being the direction cosines of the external normal to the sphere.

(AMIETE June 2010, 2009) Ans. $\frac{8\pi}{3}(a + b + c)r^3$

12. Show that $\iiint_V (u \nabla \cdot \vec{V} + \vec{V} \cdot \nabla u) dv = \iint_S u \vec{V} \cdot ds$.

13. If $E = \text{grad } \phi$ and $\nabla^2 \phi = 4\pi \rho$, prove that $\iint_S \vec{E} \cdot \vec{n} ds = -4\pi \iint_V \rho dv$ where \vec{n} is the outward unit normal vector, while dS and dV are respectively surface and volume elements.

Pick up the correct option from the following:

14. If \vec{F} is the velocity of a fluid particle then $\int_C \vec{F} \cdot d\vec{r}$ represents.

- (a) Work done (b) Circulation (c) Flux (d) Conservative field.

(U.P. Ist Semester, Dec 2009) Ans. (b)

15. If $\vec{f} = ax \hat{i} + by \hat{j} + cz \hat{k}$, a, b, c , constants, then $\iint_S f \cdot dS$ where S is the surface of a unit sphere is

- (a) $\frac{\pi}{3}(a+b+c)$ (b) $\frac{4}{3}\pi(a+b+c)$ (c) $2\pi(a+b+c)$ (d) $\pi(a+b+c)$

(U.P., Ist Semester, 2009) Ans. (b)

16. A force field \vec{F} is said to be conservative if

- (a) $\text{Curl } \vec{F} = 0$ (b) $\text{grad } \vec{F} = 0$ (c) $\text{Div } \vec{F} = 0$ (d) $\text{Curl}(\text{grad } \vec{F}) = 0$

(AMIETE, Dec. 2006) Ans. (a)

17. The line integral $\int_C x^2 dx + y^2 dy$, where C is the boundary of the region $x^2 + y^2 < a^2$ equals

- (a) 0, (b) a (c) πa^2 (d) $\frac{1}{2}\pi a^2$

(AMIETE, Dec. 2006) Ans. (b)
