# CSE4203: Computer Graphics Chapter – 3 Raster Images

#### Outline

- Raster and Raster Images
- Display Devices
- Pixel Values
- RGB Color
- Alpha Compositing

#### Credit

## **CS4620: Introduction to Computer Graphics**

**Cornell University** 

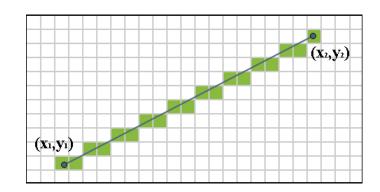

Instructor: Steve Marschner

http://www.cs.cornell.edu/courses/cs46

20/2019fa/

#### Raster (1/1)

 Most computer graphics images are presented on raster display.

- i.e. television
- has rectangular array of small light-emitting pixels
  - individually set to different colors to create desired image.

## Storing Images (1/2)

#### Raster Image:

 used to store and process images, as rasters are common in devices

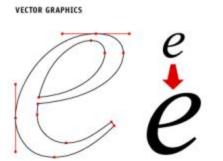

- simply a 2D array
- stores the pixel value for each pixel
- usually a color stored as three numbers (r, g, b)

## Storing Images (2/2)

- Vector Image:
  - storing descriptions of shapes
  - areas of color bounded by lines or curves
  - no reference to any pixel grid.

 Need to store instructions for displaying the image rather than the pixels needed to display it.

## Storing Images (2/2)

Vector Image:

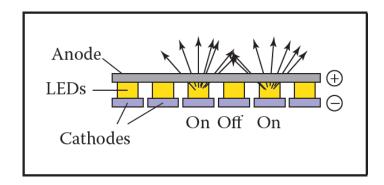

Q: Advantage/ Disadvantage?

#### Display Devices (1/1)

- Transmissive Displays:
  - require a light source to illuminate them
  - backlight behind the array
    - i.e. in a projector, a lamp emits light projected onto the screen after passing through the array.
- Emissive Display:
  - it is its own light source.

## Emissive Displays (1/2)

- Emissive Displays:
  - Example: light-emitting diode (LED)
  - Each pixel is composed of one or more LEDs (semiconductor devices)
    - emit light with intensity ↔ electrical current passing through them

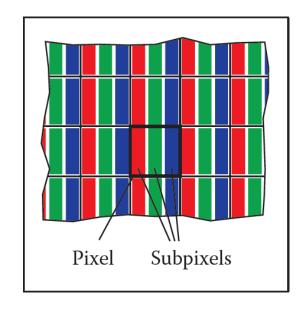

Credit: Fundamentals of Computer Graphics 3<sup>rd</sup> Edition by Peter Shirley, Steve Marschner | <a href="http://www.cs.cornell.edu/courses/cs4620/2019fa/">http://www.cs.cornell.edu/courses/cs4620/2019fa/</a>

## Emissive Displays (2/2)

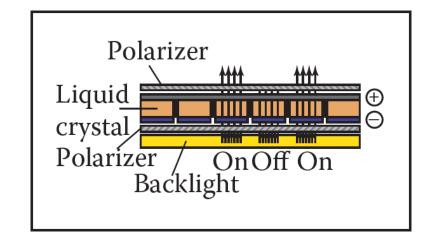

#### Sub-pixel:

- Pixels divided into three independently controlled subpixels (R, G, B)
  - each with own LED (different materials)
  - emit light of different colors

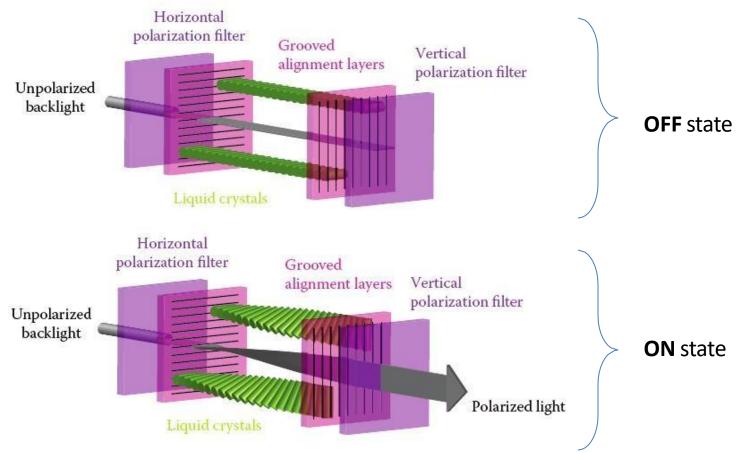

#### Transmissive Displays (1/3)

- Transmissive Displays:
  - Example: light crystal display (LCD)
- Molecular structure of liquid crystal rotates the polarization of light that passes through it
- LCDs also have sub-pixels.

#### Transmissive Displays (2/3)

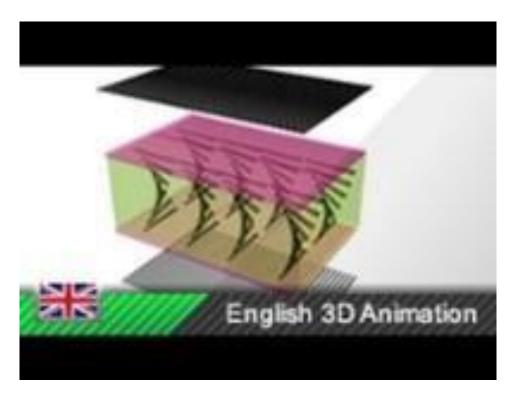

Degree of rotation ↔ applied voltage

#### Transmissive Displays (3/3)

#### youtu.be/k7xGQKpQAWw?t=77

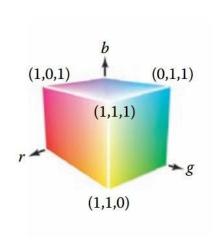

#### Pixel Values (1/1)

- Coordinate system for raster screen:
  - Convention:

#### RGB Color (1/1)

black = 
$$(0, 0, 0)$$
, red =  $(1, 0, 0)$ , green =  $(0, 1, 0)$ ,  
blue =  $(0, 0, 1)$ , yellow =  $(1, 1, 0)$ , magenta =  $(1, 0, 1)$ ,  
cyan =  $(0, 1, 1)$ , white =  $(1, 1, 1)$

## Alpha Compositing (1/3)

- Partially overwriting the contents of a pixel.
  - Where we have a background and want to insert a foreground image over it.
    - Transparent
    - Opaque (not transparent)
    - Partially Transparent

Credit: Fundamentals of Computer Graphics 3<sup>rd</sup> Edition by Peter Shirley, Steve Marschner | <a href="http://www.cs.cornell.edu/courses/cs4620/2019fa/">http://www.cs.cornell.edu/courses/cs4620/2019fa/</a> Image source: <a href="http://www.graphicalweb.org/2005/papers/abstractsvgopen/index.html">http://www.graphicalweb.org/2005/papers/abstractsvgopen/index.html</a>

## Alpha Compositing (2/3)

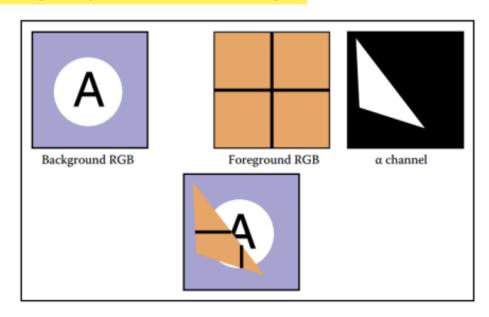

foreground and background must be blended.

$$c = \alpha c_f + (1 - \alpha)c_b$$

•  $\alpha$  = Fraction of the pixel covered by the foreground layer

#### Alpha Compositing (3/3)

- Alpha Mask:
  - The  $\alpha$  values for all the pixels is stored in a separate gray scale image.

Credit: Fundamentals of Computer Graphics 3rd Edition by Peter Shirley, Steve Marschner | http://www.cs.cornell.edu/courses/cs4620/2019fa/

#### Practice Question 1

• Given that,  $C_f = 1.0$ ,  $C_b = 0.5$  and C = 0.8, where,  $C_{f_s}$ ,  $C_b$  and C are the foreground, background and composite intensities respectively. Determine the alpha( $\alpha$ ) value to perform alpha compositing.
